How did the Horse Genome Project Start? 1990: Plan for Human Genome Sequence

1992: USDA Animal Gene Mapping
1995: 1st Horse Genome Workshop
1996: Horse added to USDA Animal Gene Mapping
Projects -- as an International Program

2003: Human Genome Sequence Completed

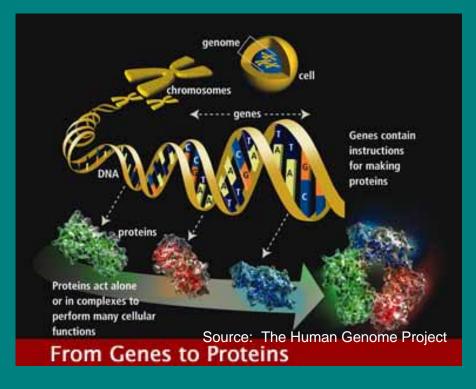

Source: www.horsepresence.com

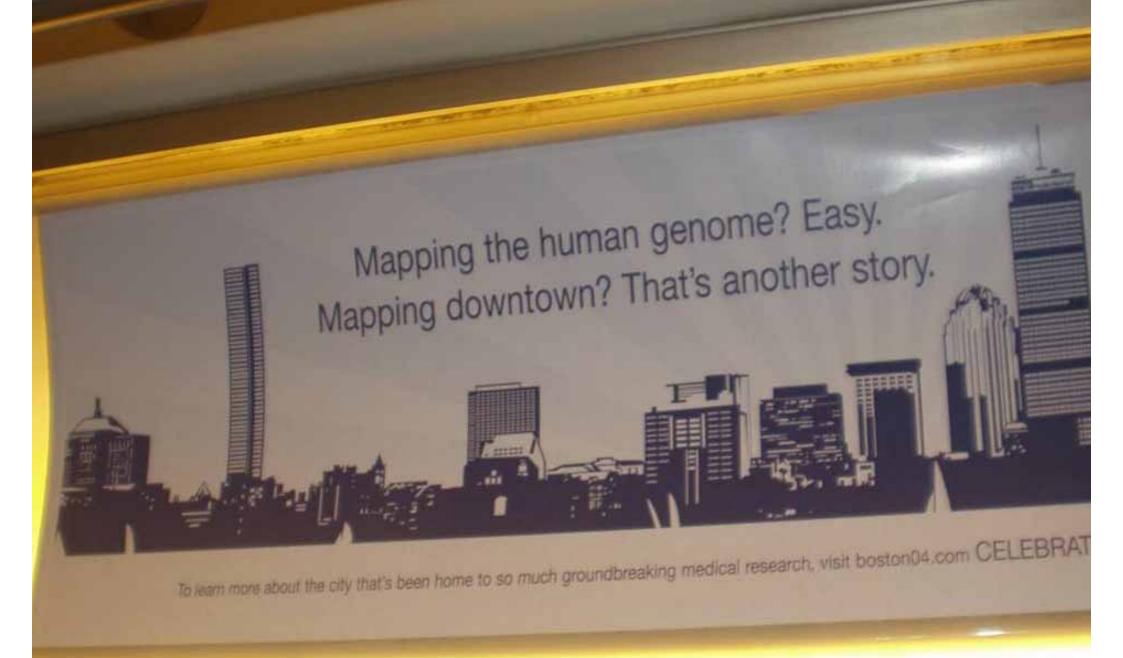

How has the Human Genome Project been Informative & of Benefit to People?

Information:

- •99.9% Same for All People
- •2% encodes proteins
- •20,000 genes
- •Complexity due to gene regulation, not gene number!!
- **Benefits:**
- •Genetic Tests
- Individualized Drug Therapy

Mutations cause Muscular Dystrophy, Cystic Fibrosis, Neurofibromatosis, Sickle Cell Anemia, Cancers, etc.

Animals Protest NHGRI Priorities

By Martha J. Heil

BETHESDA, MD — Responding to an NHGRI report naming six "high-priority" organisms for genome sequencing, thousands of animals took to the NIH campus here today to protest.

The animals, including the *Xenopus* frog, pig, and duckbilled platypus, insisted that the selection of some organisms over others amounted to genetic discrimination. "It's bad enough that we are burdened with being the universal metaphor for everything filthy," said the pig with a snort.

Protesters sang, croaked, buzzed, squealed, and threw their own feces at researchers entering the NHGRI labs. "No wonder we're going mad," said the cow, threatening to hold a milk strike.

Why did NHGRI sequence the horse?

Why didn't they sequence a zebra or rhinoceros?

Make the case for sequencing horses

Gerard Guerin, France; Telhisa Hasegawa, Japan; Kamal Khazanehdari, Dubai; Bhanu Chowdhary, Texas; Ernie Bailey, Kentucky

http://www.uky.edu/Ag/Horsemap

The International Equine Gene Mapping Workshop began in 1995 and is conducted by the Dorothy Russell Havemeyer Foundation. In 1997 the Horse Technical Committee of the National Research Sponsored Projects-8 (NRSP-8) of the United States Department of Agriculture National Animal Genome Research Program (USDA-NAGRP) was formed. These programs work in concert to foster international collaboration in the field of horse genomics.

This page describes resources for genomics research as well as some of the accomplishments by scientists working on horse genomics. This website is supported, in part, by funds from the USDAS-CSREES National Animal Genome Research Program through National Research Sponsored Projects-8 (NRSP-8) and the Dorothy Russell Havemeyer Foundation, Inc.

The cave horse images were designed by Elizabeth Gehlbach and represent the ancestors of modern horse breeds. The website was designed by Elizabeth Gehlbach.

NHGRI Proposal for Whole Genome Sequencing

Molecular Tests before Sequencing

- 1. Hyperkalemic Periodic Paralysis HYPP (Quarter Horses)
- 2. Severe Combined Immunodeficiency SCID (Arabians)
- **3. Coat Color** Chestnut, Tobiano, Sabino, Palomino, Bay, Black, White, Grey
- 4. Overo Lethal White Foal Disease LWF (Paints)
- 5. Junctional Epidermolysis Bullosa JEB (Draft)
- 6. Glycogen Branching Enzyme deficiency GBE (Muscle)
- 7. Sex Determining Region Y SRY (Fertility)
- 8. HERDA (Quarter Horses)
- 9. Parentage Testing Microsatellite DNA markers

(Low Hanging Fruit - Simple Genetics)

Traits with Complex Inherited Components > Developmental Bone Diseases – OCD, Wobblers > Congenital Disorders – Contracted Foal Syndrome, Microopthalmia, Dwarfism, Parrot Mouth, El > Muscle diseases – "Tying Up" **Response to Infectious Pathogens** – EPM, Parasites, Strangles, West Nile, EVA carrier state, etc. > Understanding Aging – Arthritis, Cushing's > Allergic Diseases – Summer Eczema, COPD >Laminitis > Performance – strength, speed, endurance jumping, athleticism Behavior – gaits, stable vices, demeanor

Time Table for Horse Genome Sequencing

Proposal submitted July 2005
Broad asks for DNA Nov 2005
Broad begins sequencing Feb 2006
NHGRI announce July 19, 2006
6.8X sequence July 2006

First Assembly February 2007
Final Assembly Fall 2007

Complete Sequence for inbred female Thoroughbred: 6.7X coverage

<u>Genetic Variants</u>: Spot sequence 7 breeds, Thoroughbred, Standardbred, Quarter Horse, Arabian Horse, Akal-Teke, Icelandic and Andalusian, at 100,000 sites: 1.47 million single nucleotide Polymorphisms (SNPs) Do SNPs occur randomly or in blocks? 100 SNPs compared in 10 2MB regions for 24 horses of 11 different breeds:

Thoroughbred, Standardbred, Quarter Horse, Arabian, Andalusian, Icelandic, Hannoverian, Hokkaido, French Trotter, Norwegian Fjord, American Saddlebred.

Saw average of 19 Blocks of SNPs for 10 regions... but only 5 within a particular breed.

Genetic Studies: SNP Arrays

- 1.4 million base substitions identified (Single Nucleotide Polymorphism or SNP)
- 1 SNP found about every 1200 base pairs
- Use depends on "Linkage Disequilibrium" (LD)
- What is LD and how can we use it?

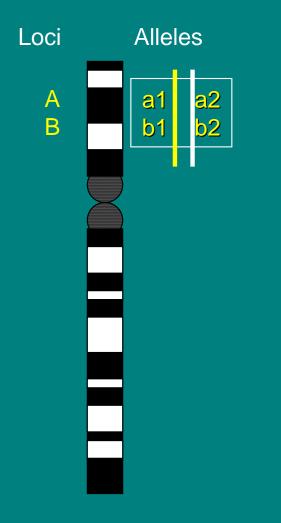

Chromosomes: the primary units of linkage

Meiotic recombination decreases the size of the linkage unit every generation.

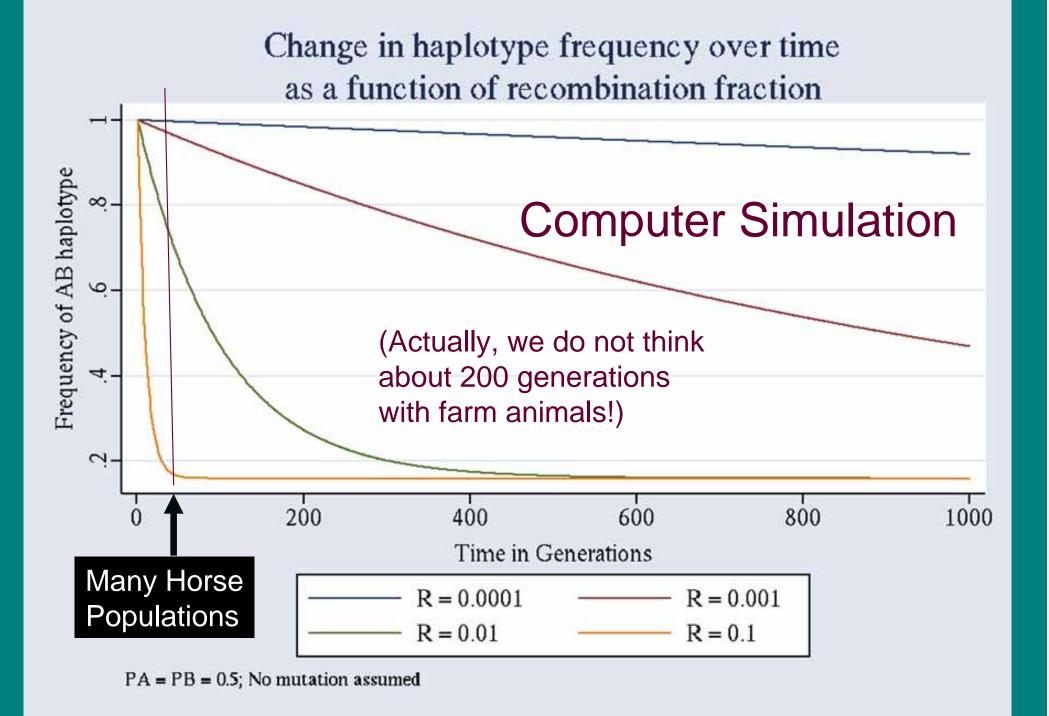

The size of the linkage unit is called LD and varies between populations.

Consider two linked loci... A & B... -- Can the allele at A be used to predict the allele at B?

From http://slack.ser.man.ac.uk/theory/ld_gen.html

Humans have <u>small LD</u>... large populations separated by many generations.

Dogs have <u>large LD</u>... small populations and separated by fewer generations

Horses.... Intermediate sized LD

- tougher to find genes than in dogs

- better model for humans than dogs

For horse research... We can afford 60,000 SNPS. Therefore we need lots of horses for association studies... - several hundred for simple traits - perhaps a thousand for complex traits

Association Studies to begin by Spring 2008

OCD, Recurrent Airway Disease, Tying up, Lordosis, Dwarfism, Contracted Tendons, Fractures and other conditions.

Physiology & Genetics: Expression Arrays

- DNA chip with DNA sequences from all 20,000 genes.

-Isolate mRNA from tissue, convert to cDNA and assay presence, absence & amount

- Assays are quantitative and qualitative.

- Verify with qRT-PCR

Expression Arrays

...by the math

- 20,000 genes
- 10,000 expressed in a cell at a time
- Tissues composed of many cell types
- Response to treatment may be variable for time of expression and amount.
- Is the measured response cause or effect?

Expression arrays are currently used to study cartilage function, performance, inflammation and response to infectious diseases.

This is the tool for nutrigenomics.

Many opportunities for intelligent choices!

<u>Combined strategy</u>: 1) Use SNP array study to identify chromosome region with QTL.

2) Use expression array to find gene in QTL region with differential expression.

-Learn how to use the information available online. http://www.genome.ucsc

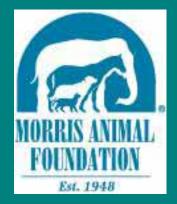

-Think inside the black-box.

-If not for us...

for our students!
