

Practice on castration of piglets in Europe

Results of Work package 2 in the EU project
PIGCAS (2007-2008)

B Fredriksen¹, M Font i Furnols², K. Lundström³,
A Prunier⁴, F Tuyttens⁵, W Migdal⁶, M Bonneau⁴

¹*Animalia, Oslo, Norway*, ²*IRTA, Monells, Spain*,

³*SLU, Uppsala, Sweden*, ⁴*INRA, Saint Gilles, France*,

⁵*ILVO, Melle, Belgium*, ⁶*ARC, Cracow, Poland*

Objectives WP2

- To improve knowledge on the extent of the practice of castration and how it is performed in Europe
- To gather and evaluate information about
 - extent of practice
 - conditions under which castration is performed
 - variations between countries
 - variation between production types

Collecting the data

- National contacts (24)
- Regional co-ordinators (5)
- Stakeholder organisations
 - Farmers/breeders
 - Veterinarians
 - Meat industry
 - Pig health services
- Common questionnaire

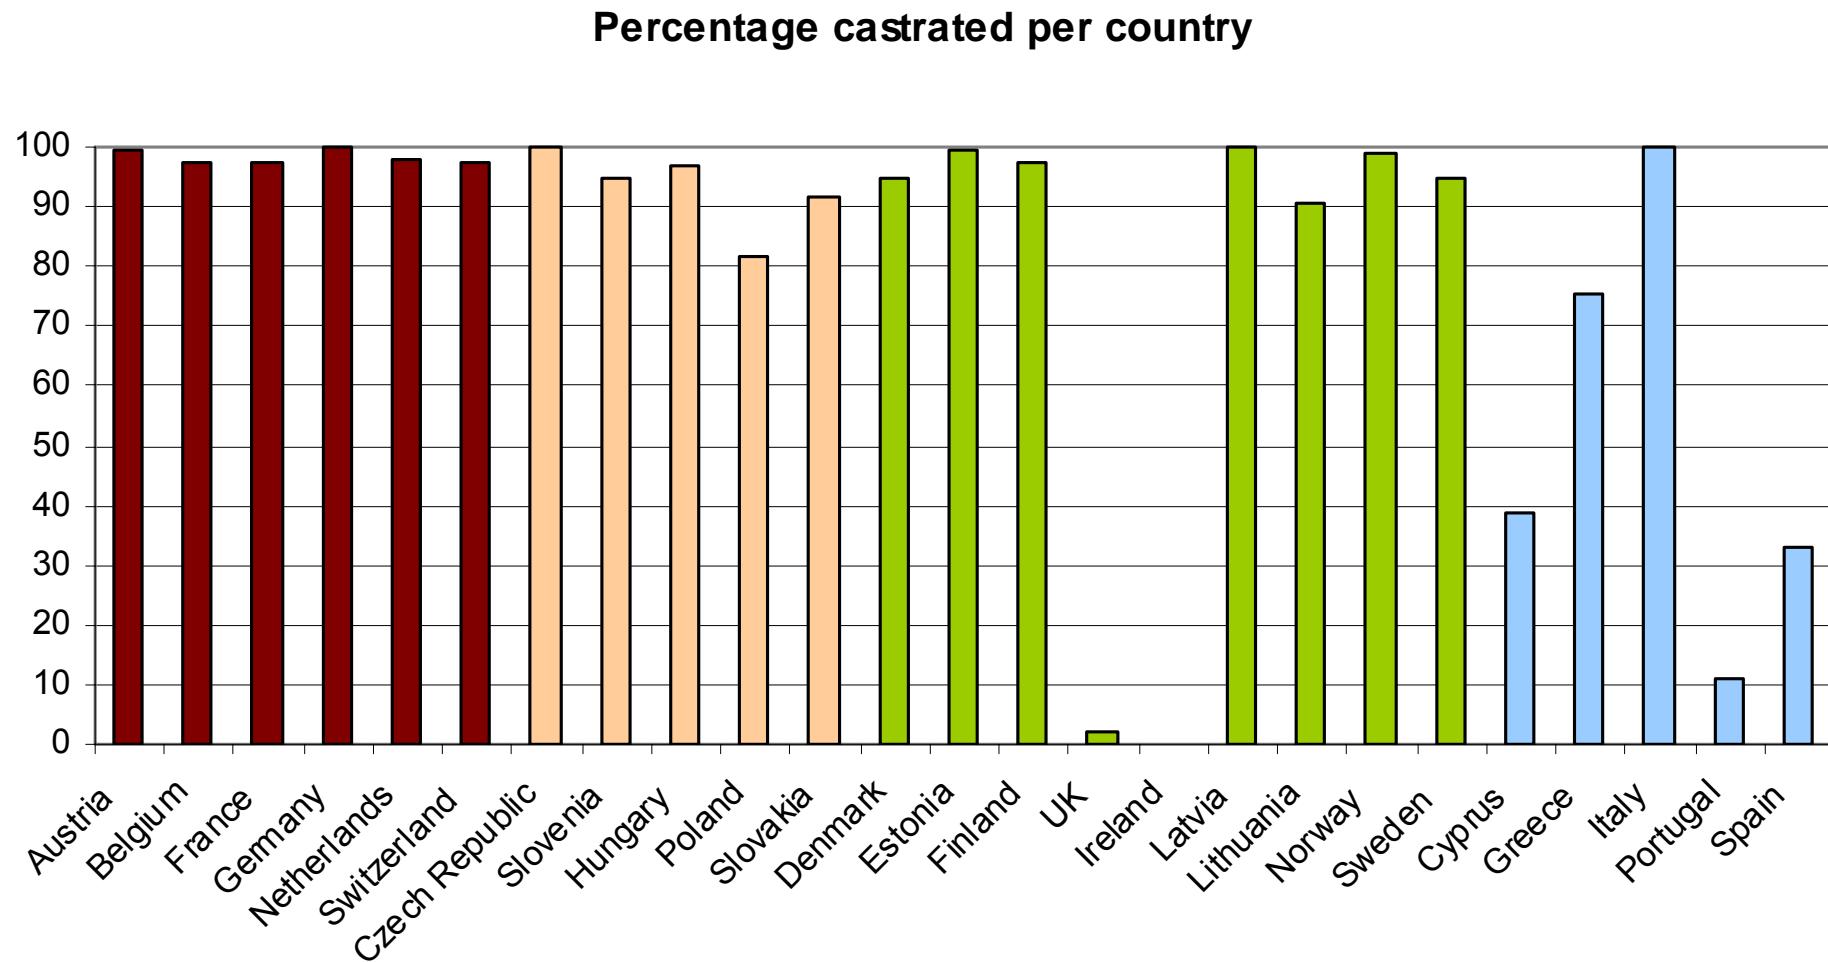

Presentation of the data

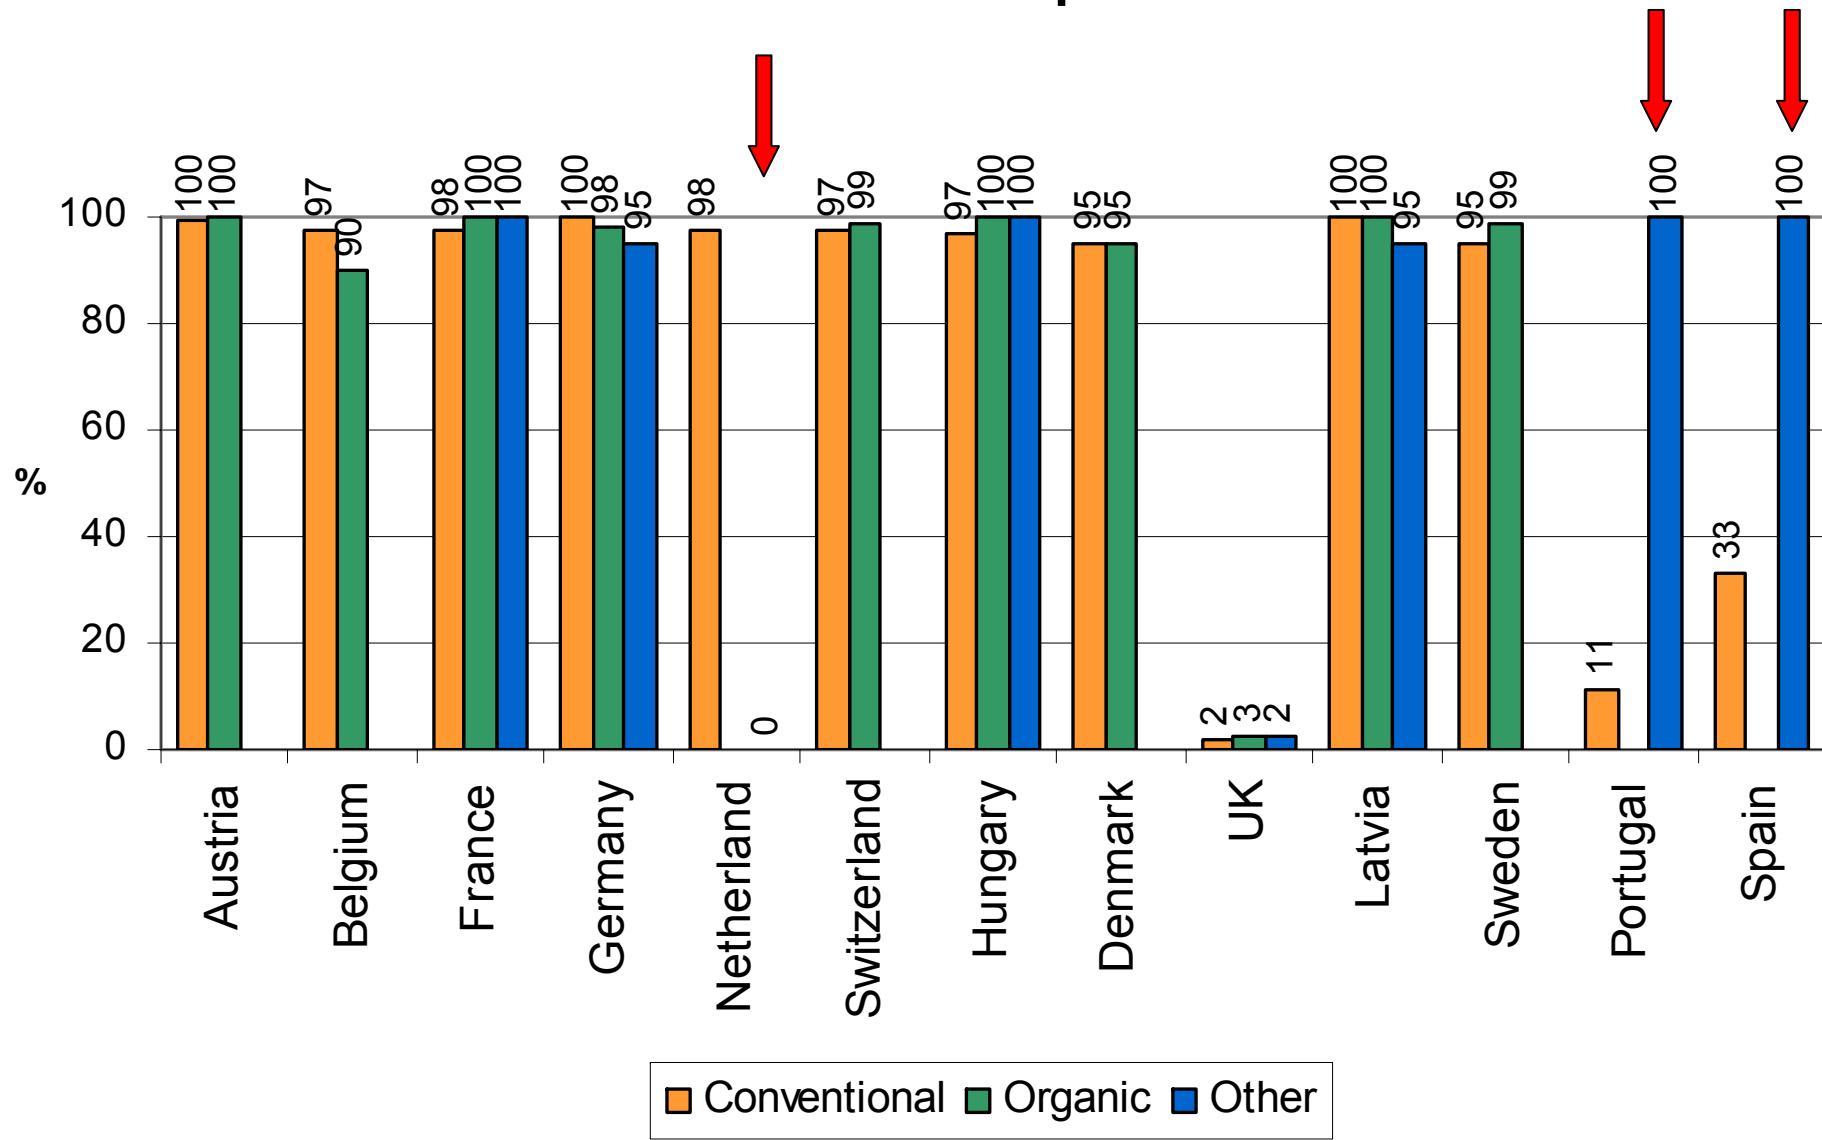

- Average within each country
- Distribution of answers within each country
- Different production systems treated separately
- Comparision of stakeholder groups – not possible

**➤ Interpretation of the results
must be done with care**

Percentage of male pigs castrated – conventional production

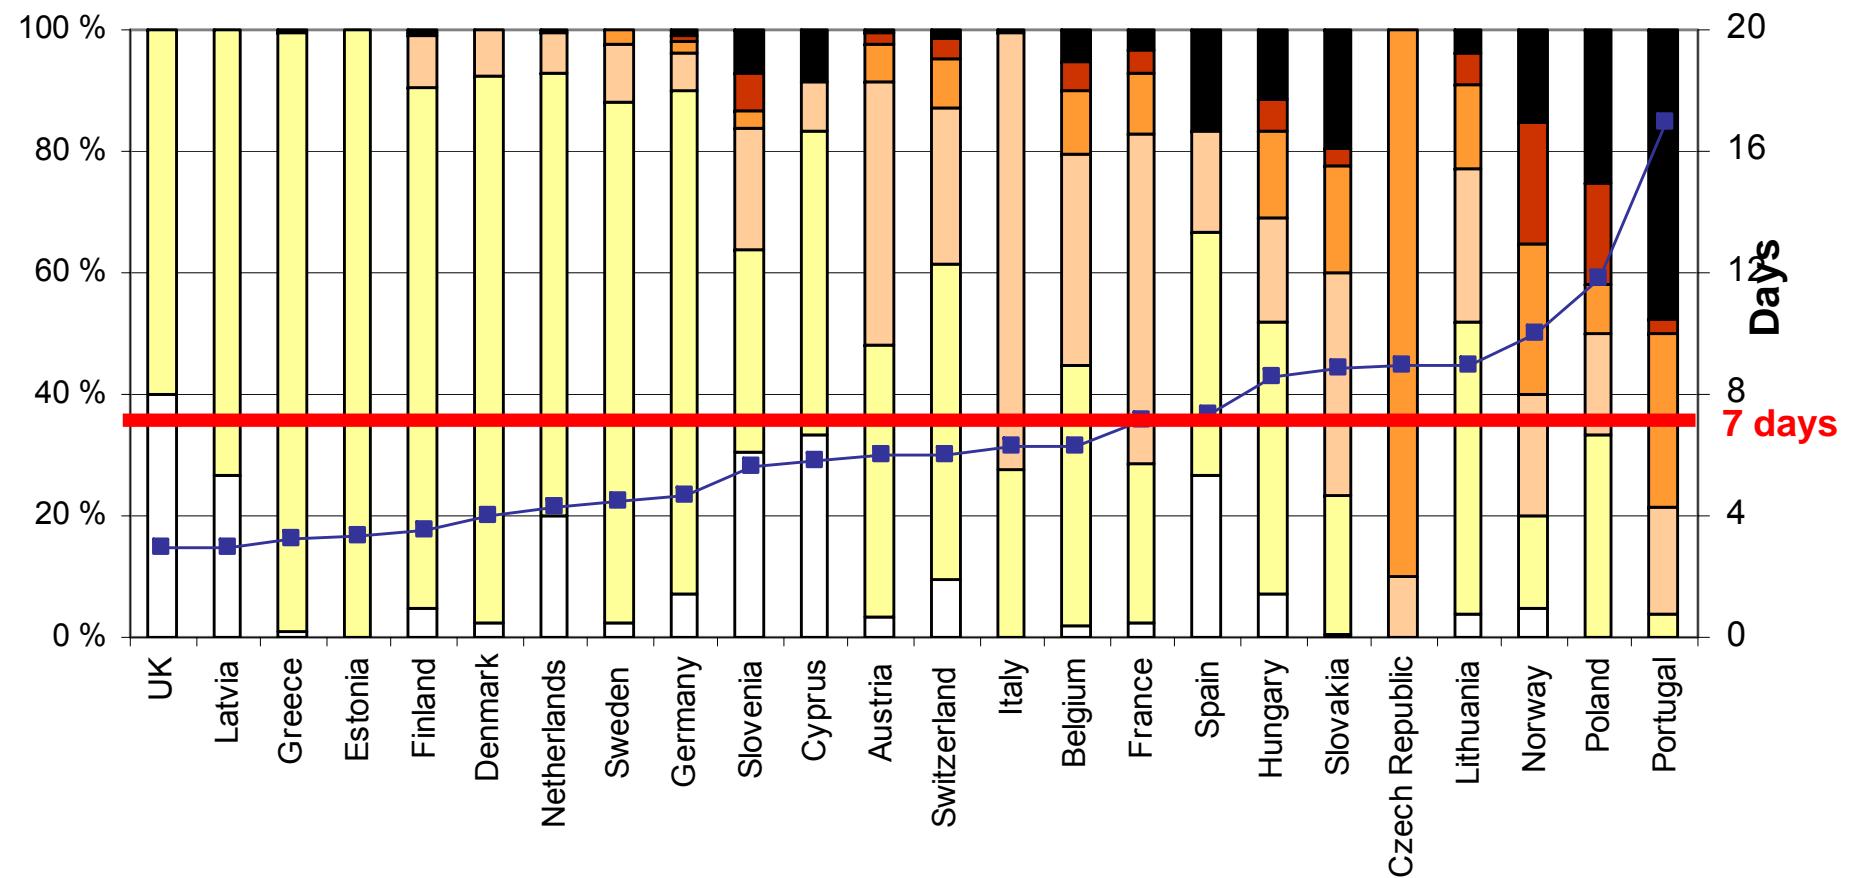

Percentage of male pigs castrated non-conventional production

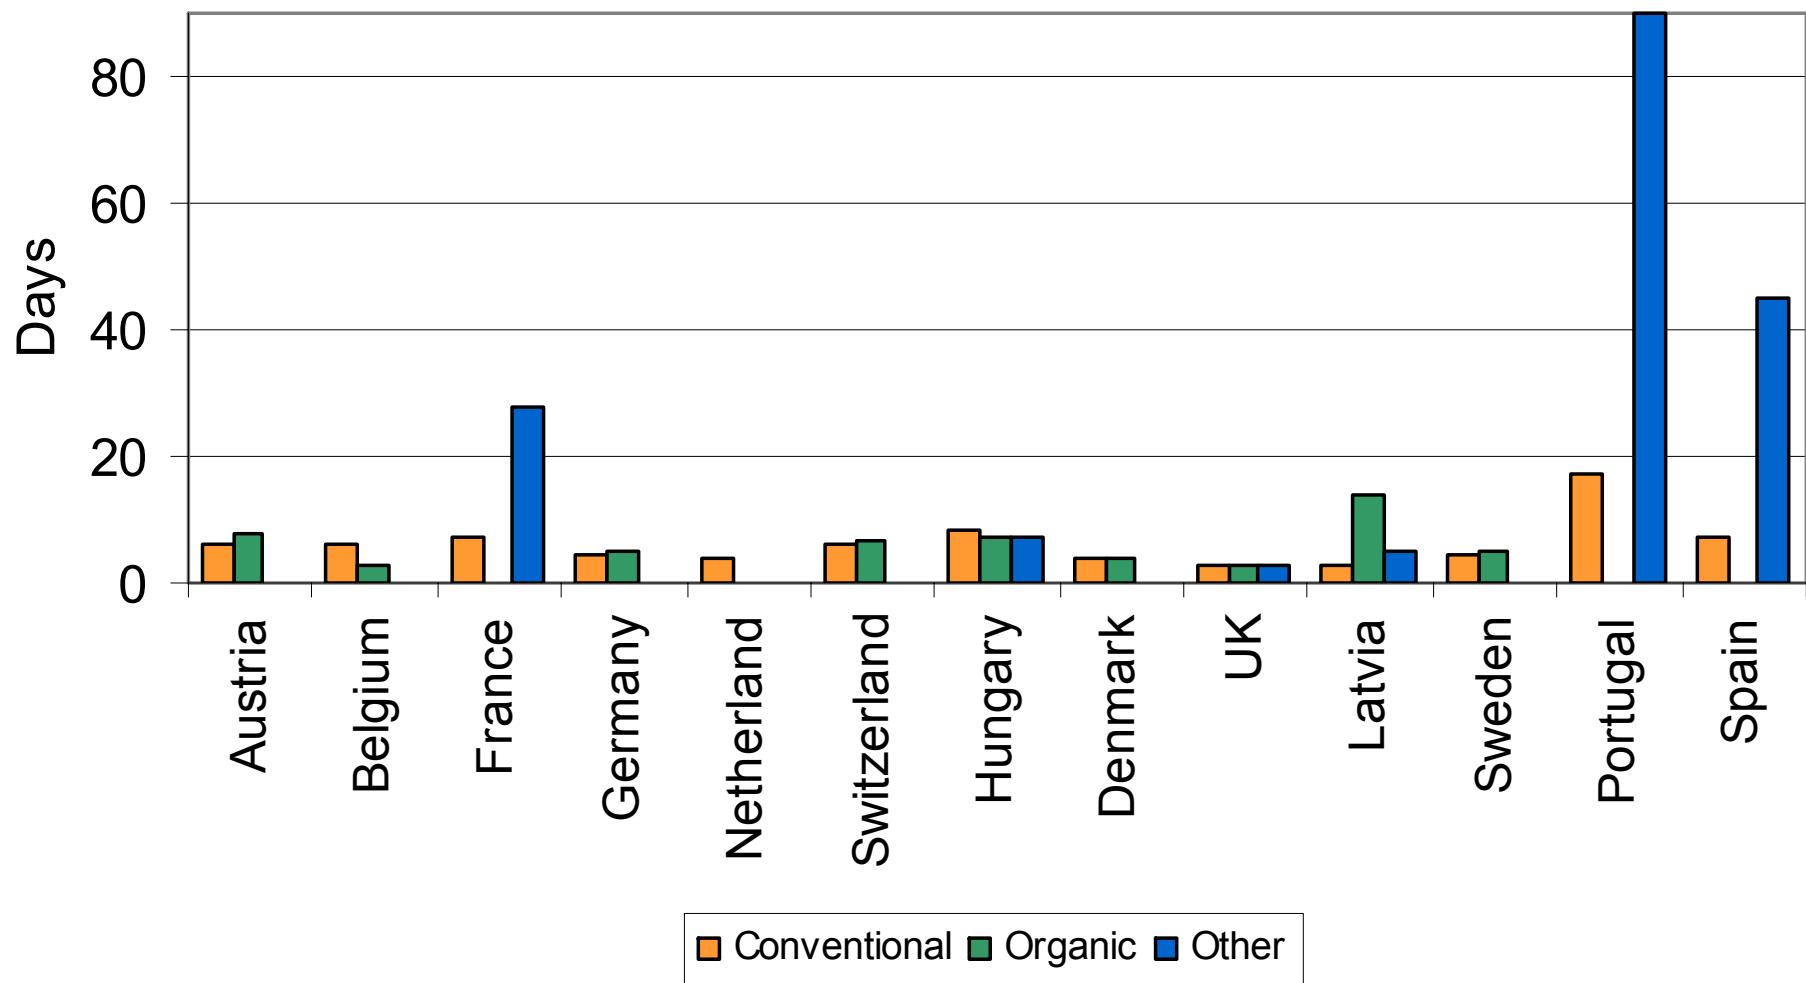

Age at castration

– conventional production

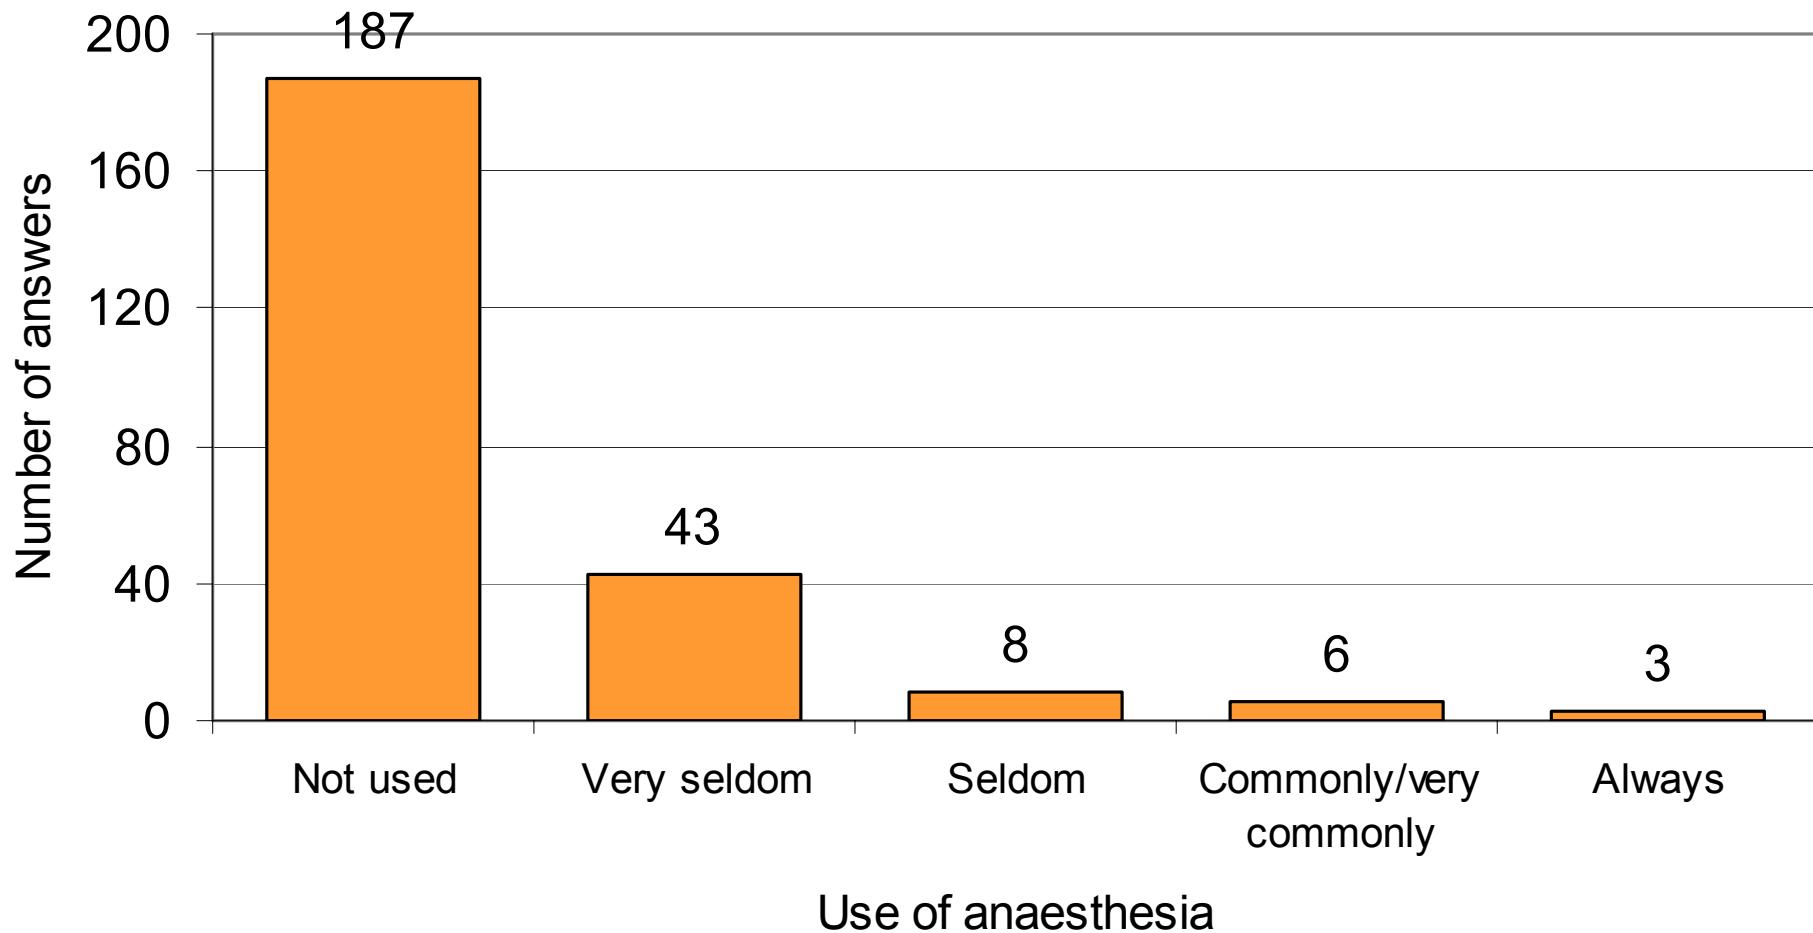

<2 days
 3-5 days
 6-8 days
 9-11 days
 12-14 days
 >14 days
 —■— Mean_age

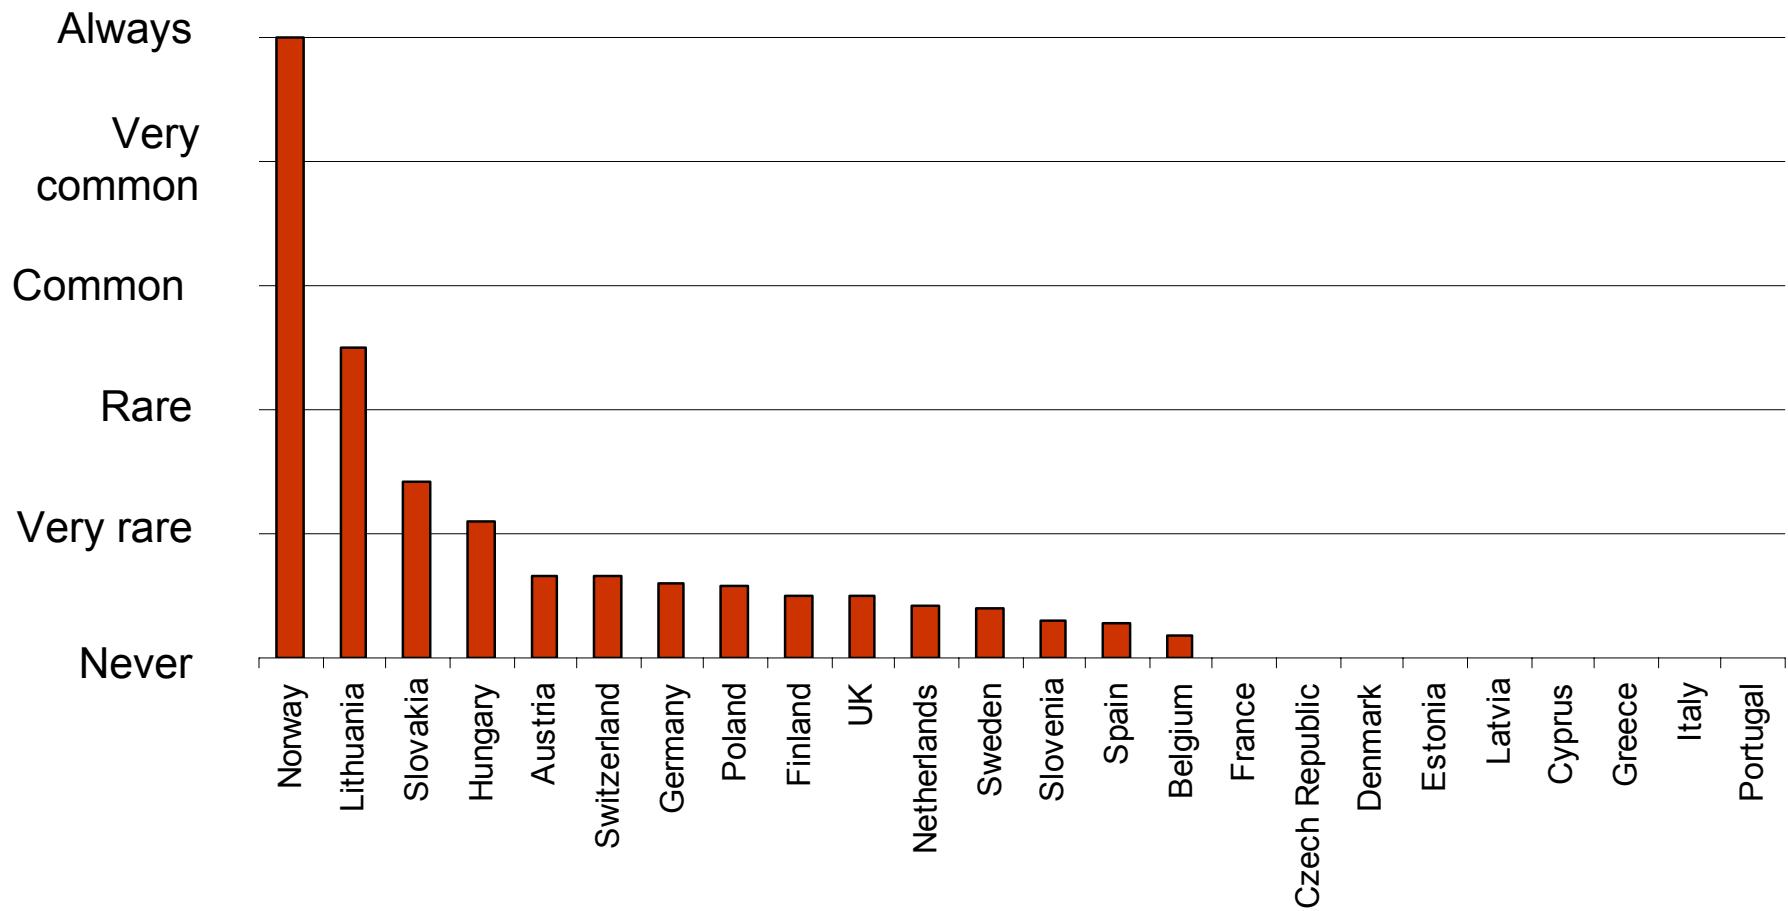

Age at castration non-conventional production

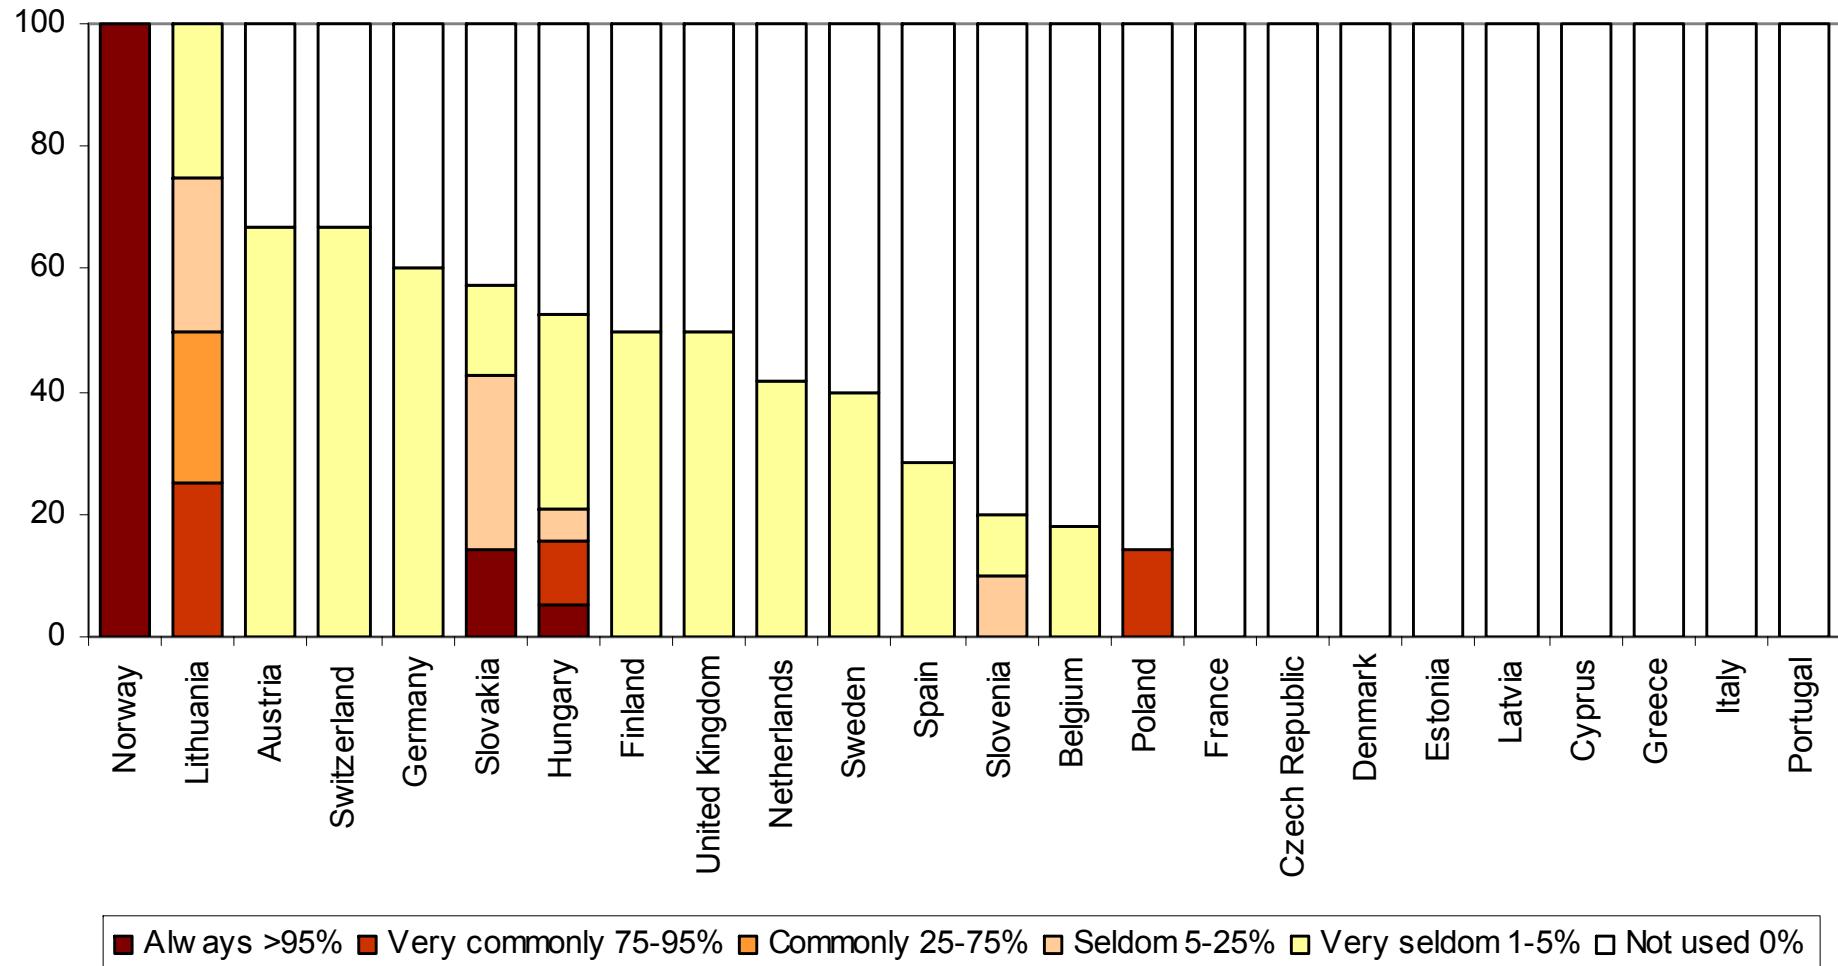

Use of anaesthesia – overall

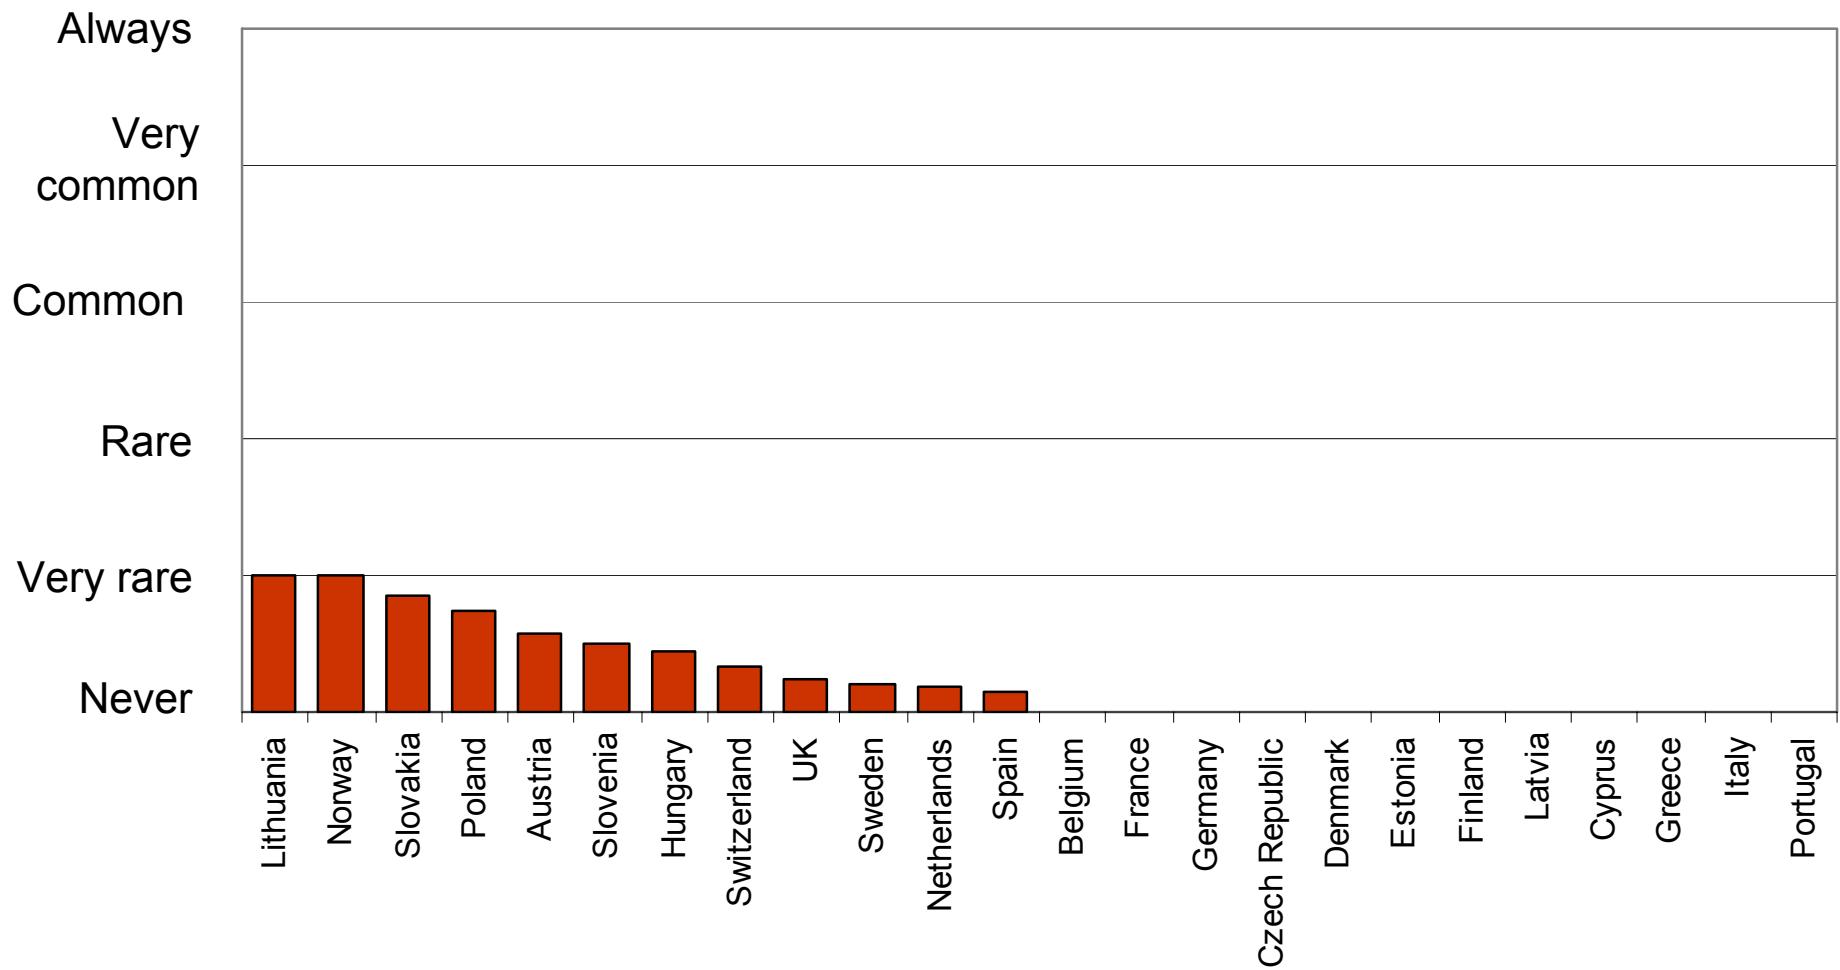

Anaesthesia - average

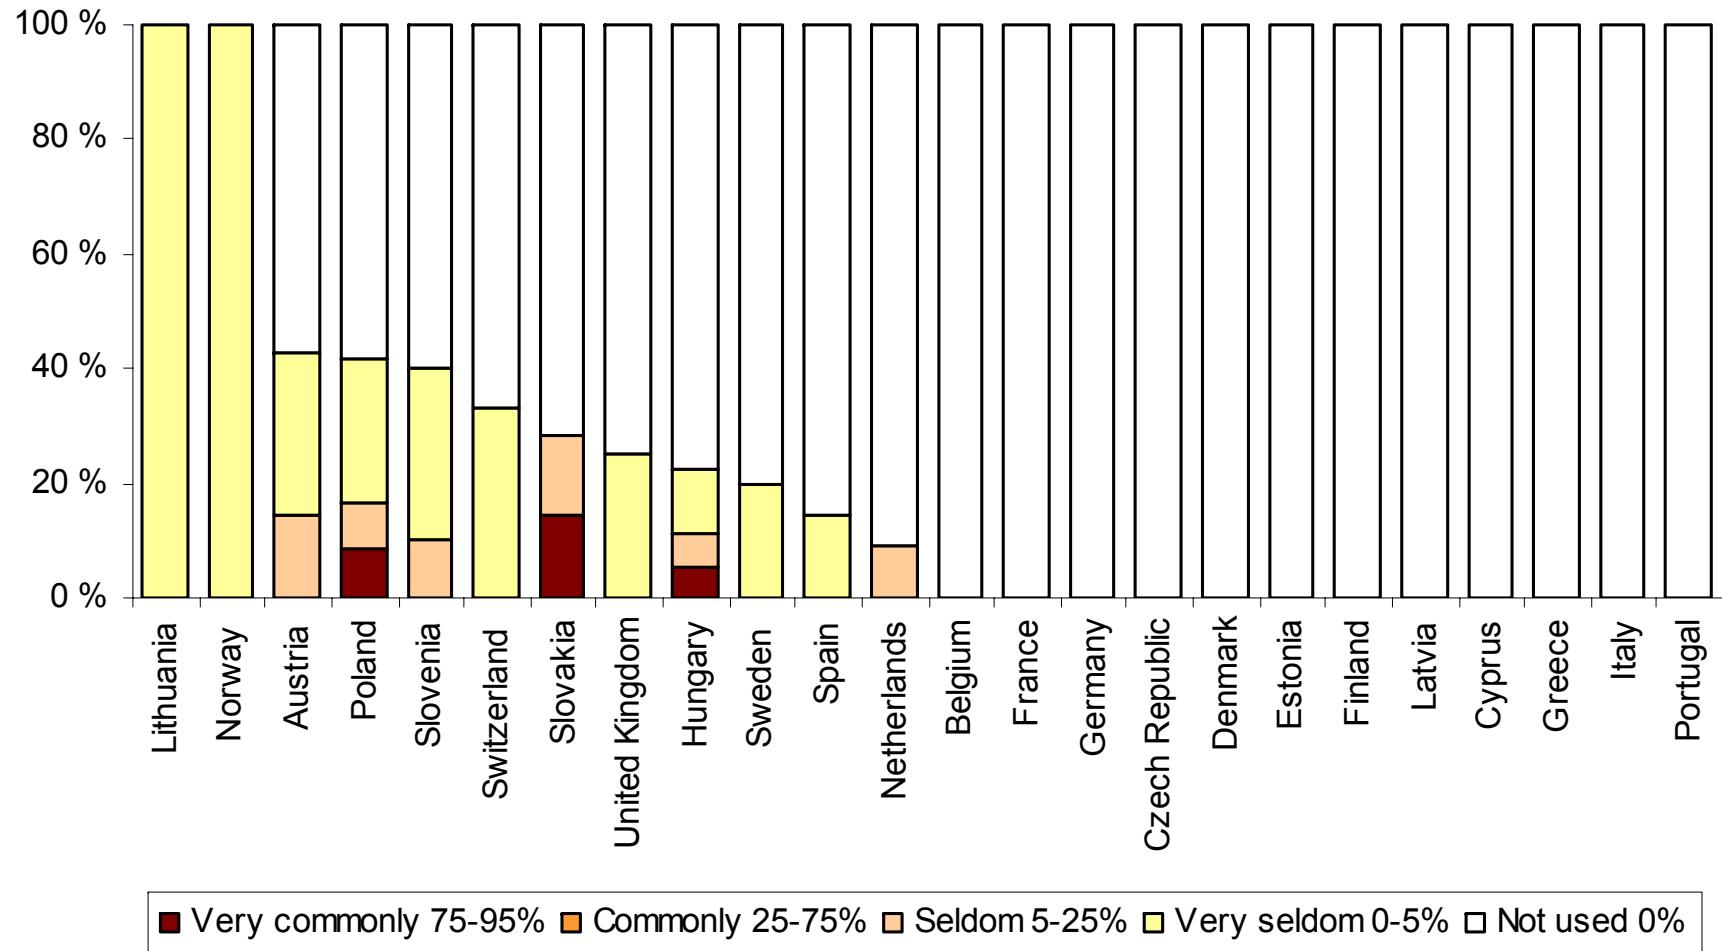

Anaesthesia - distribution

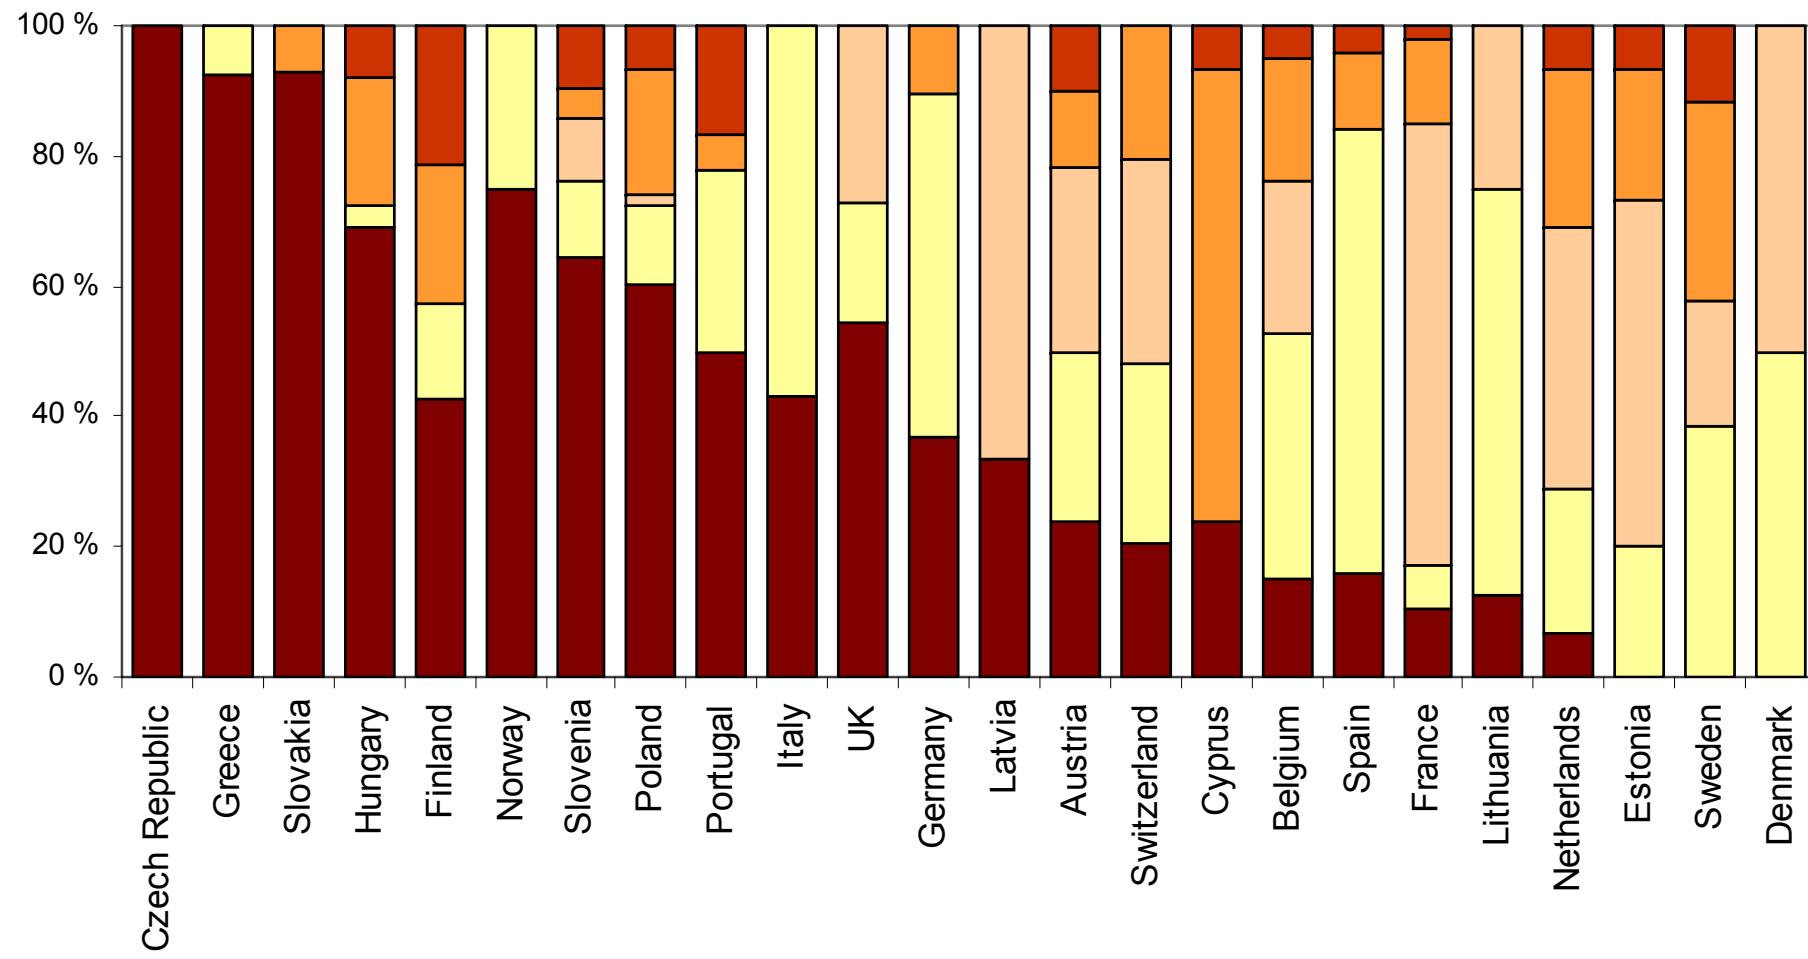

Analgesia - average

Analgesia - distribution

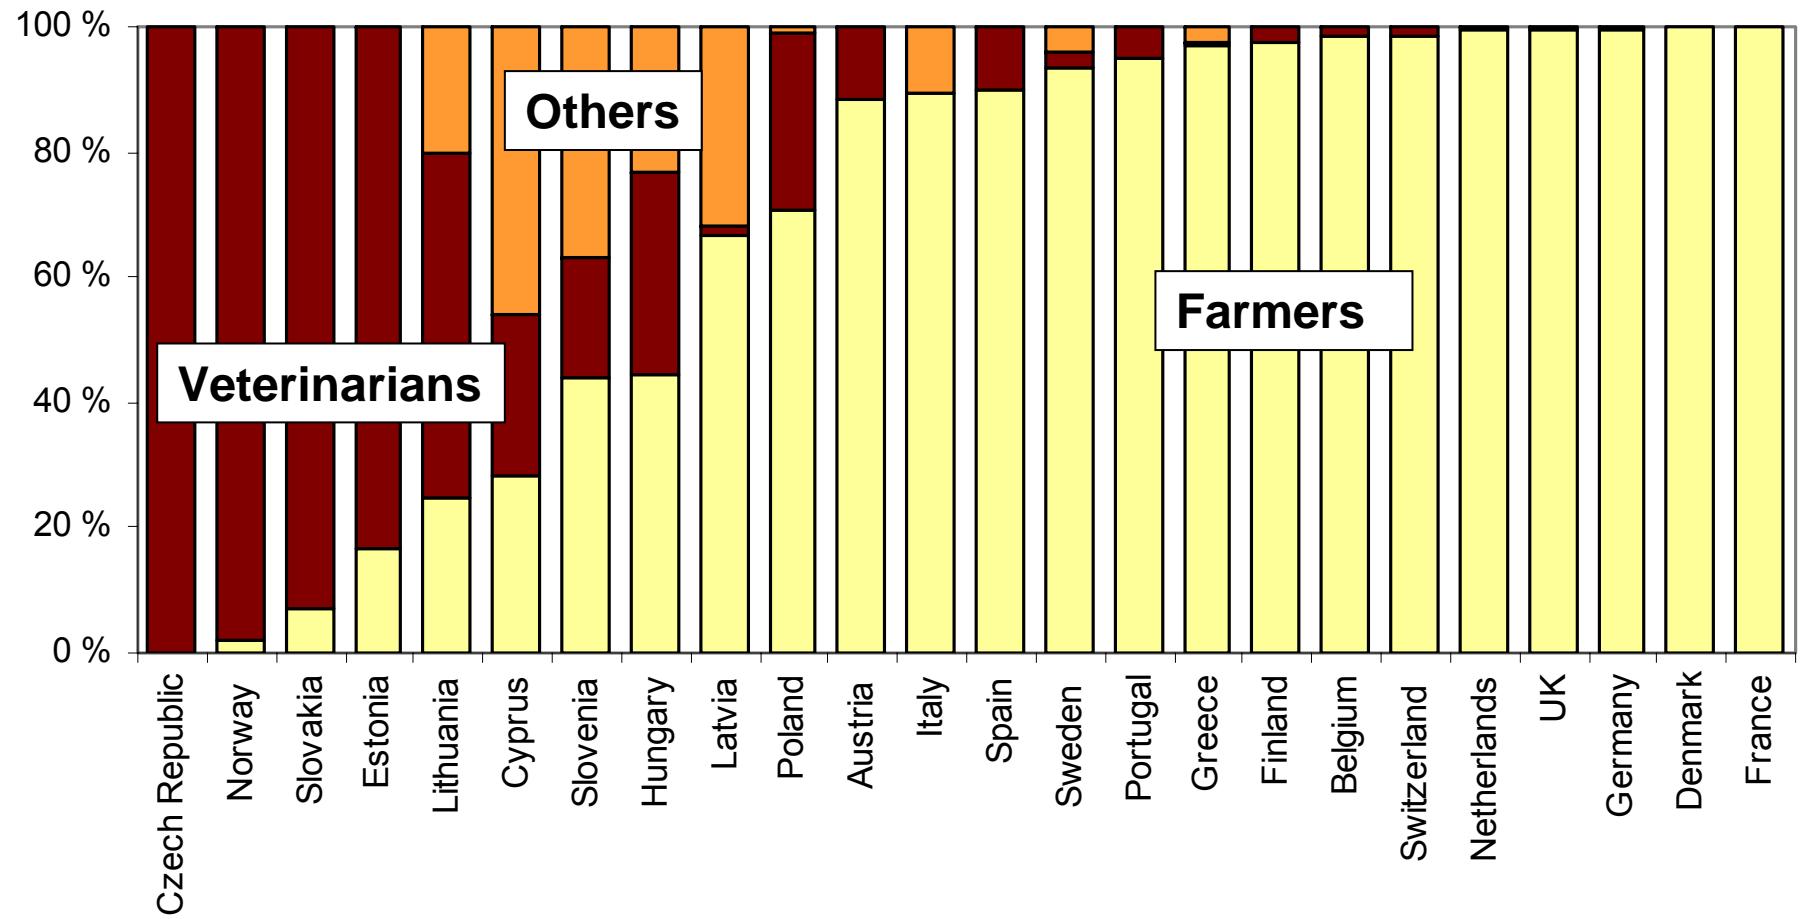

How common are these different types of restraining of piglets during surgery?

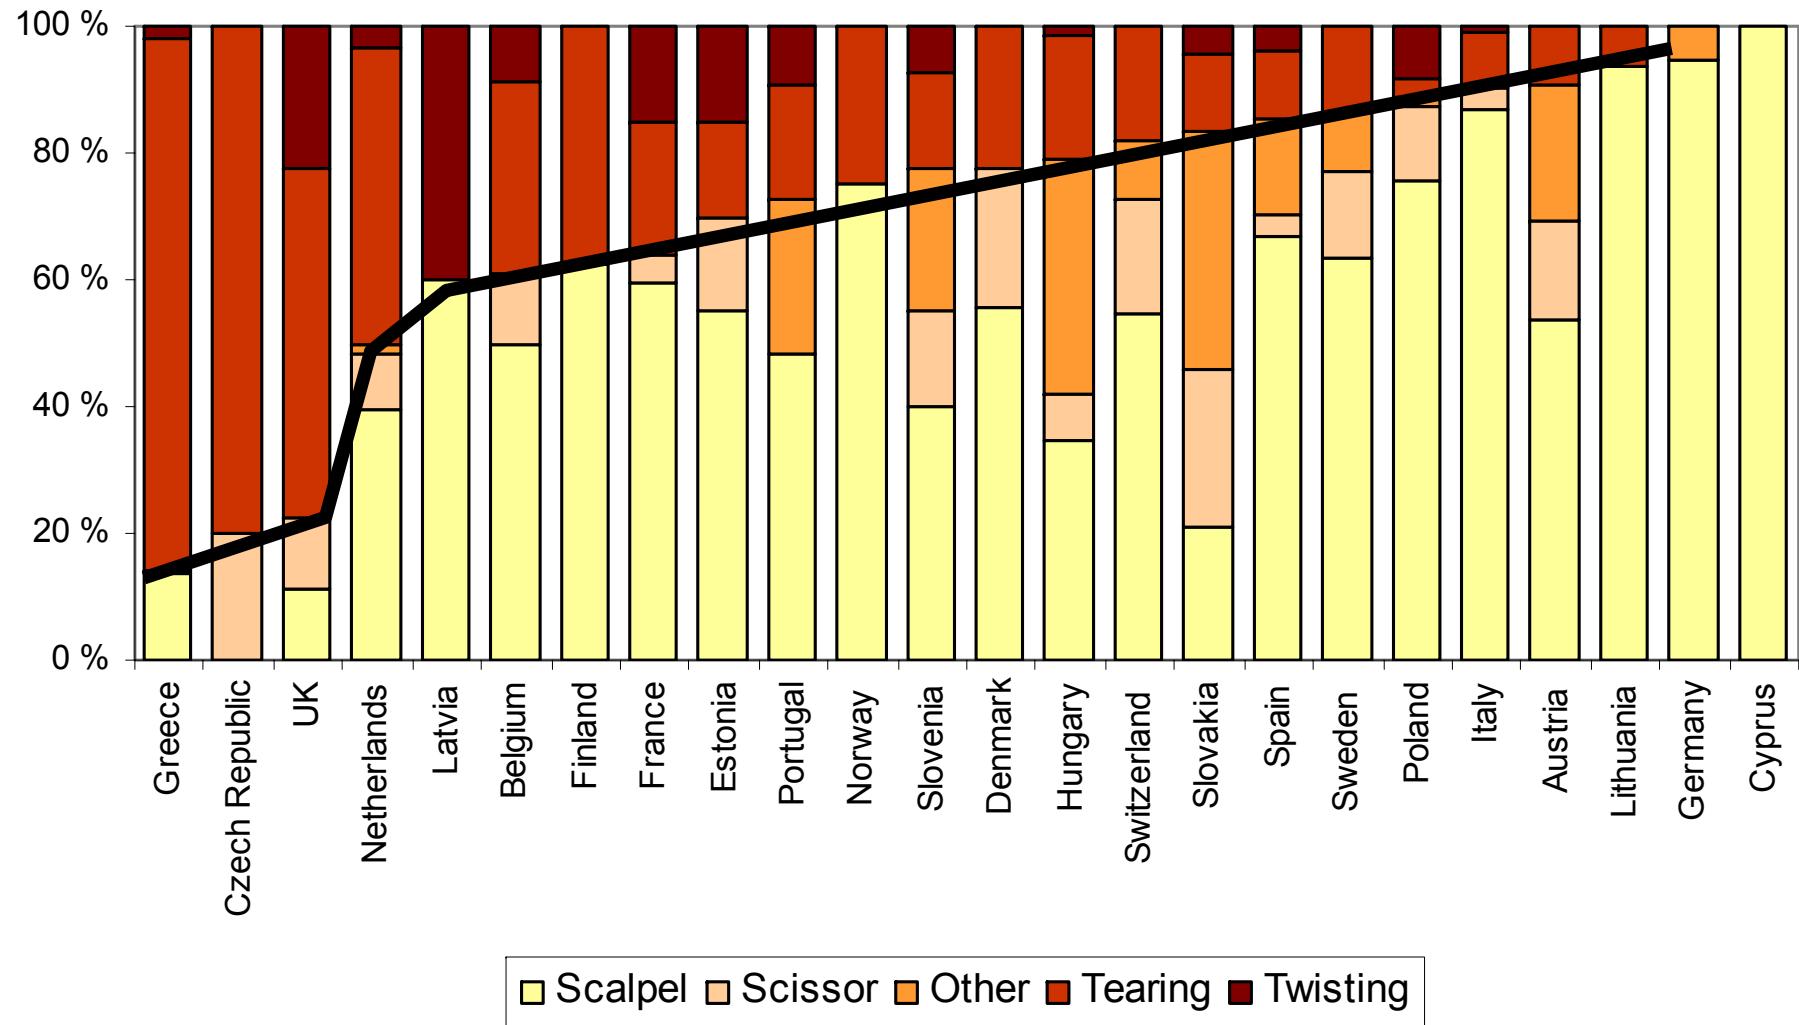

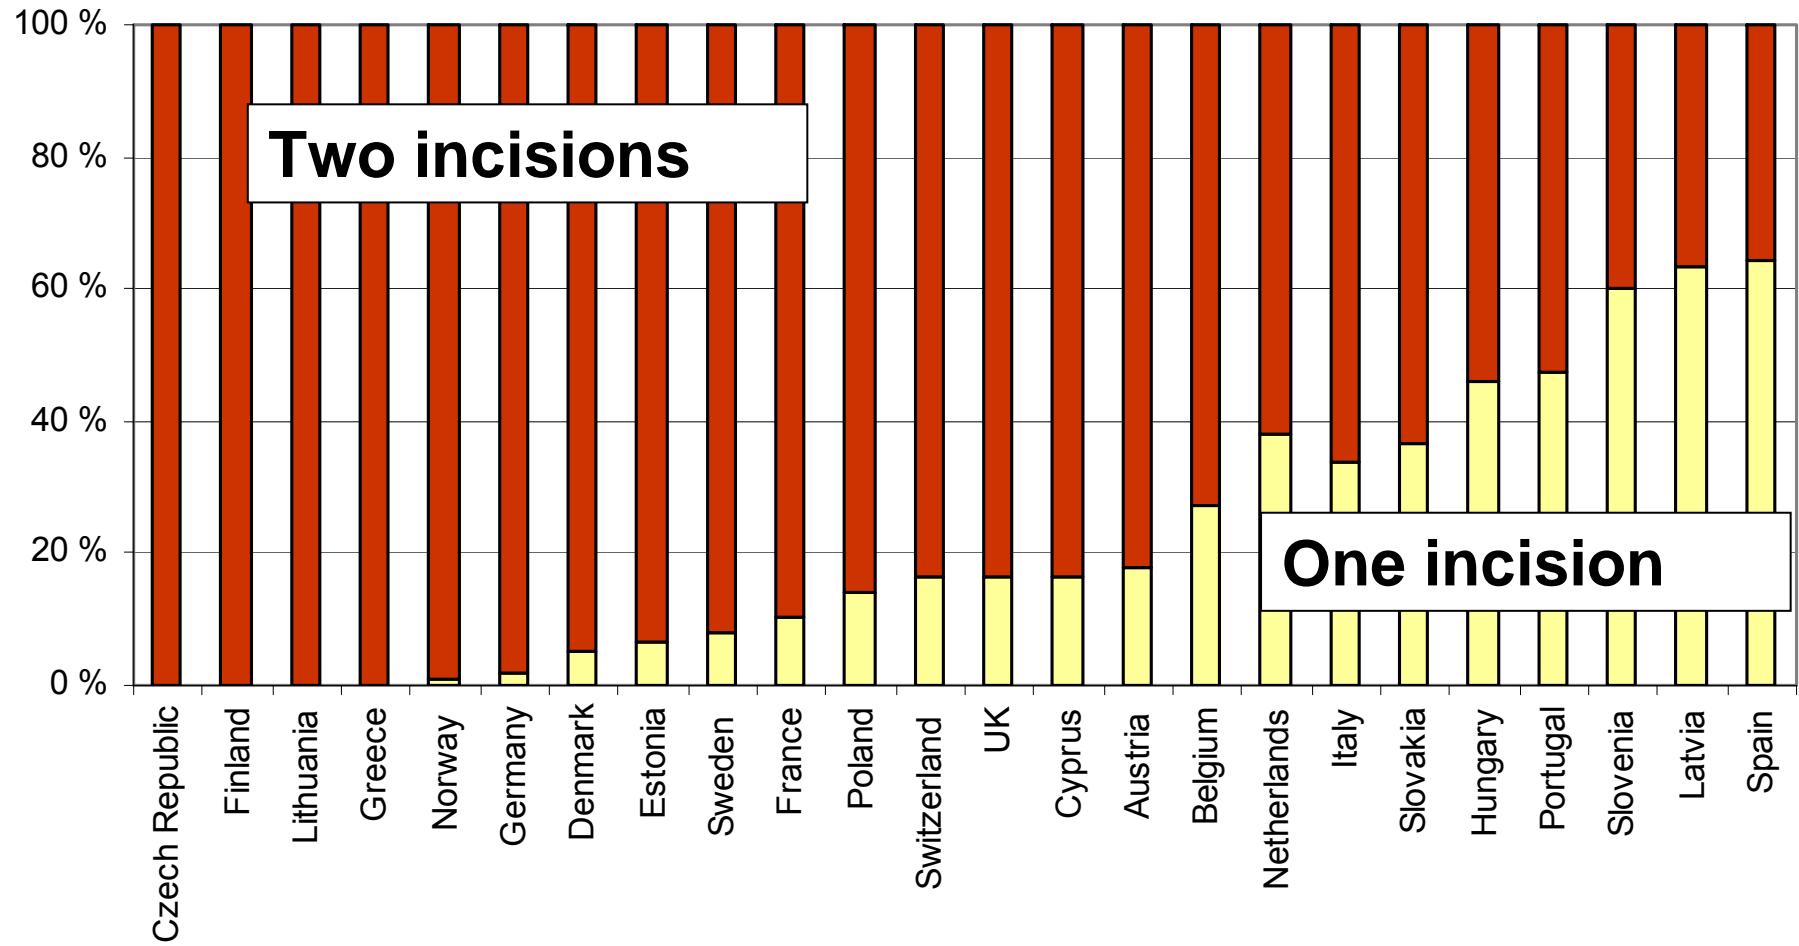

■ Suspended by the legs ■ in a commercially available device ■ Other methods ■ in a v-trough ■ held on flat bench

Who performs the castration?

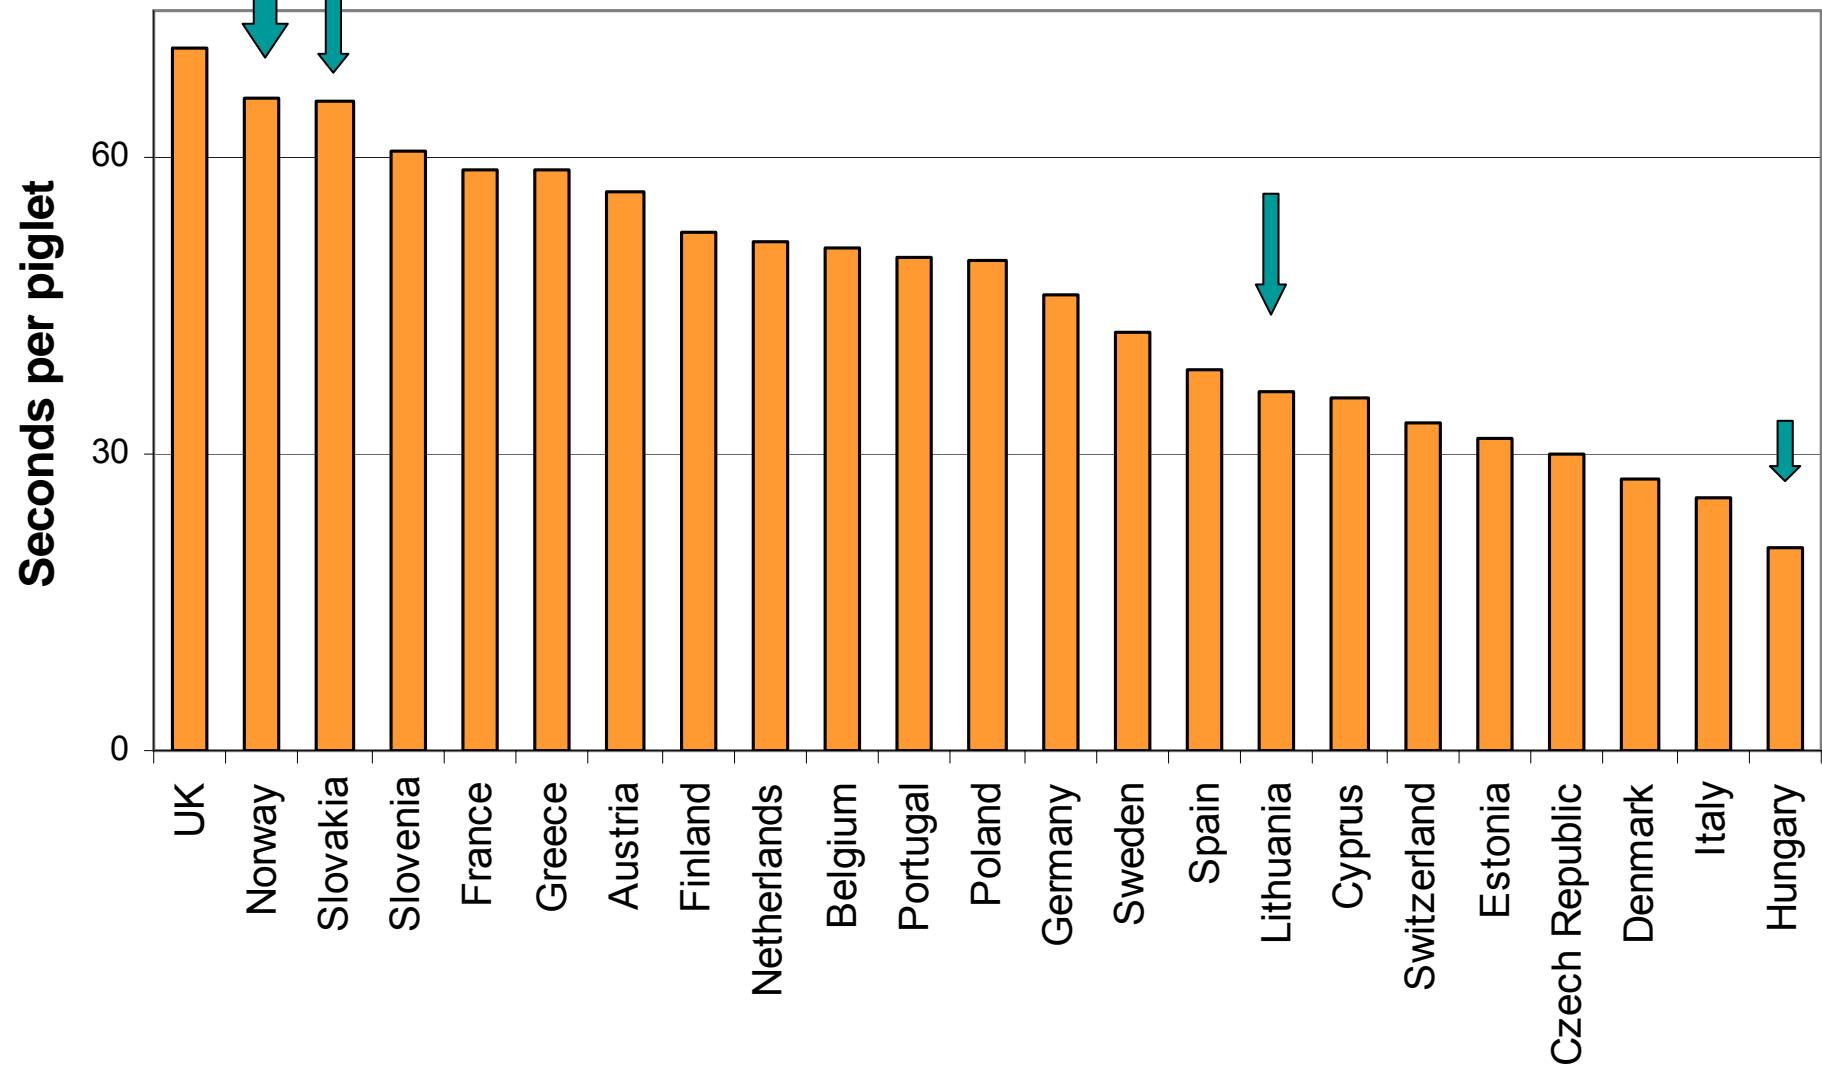

Procedures used to cut the spermatic cord

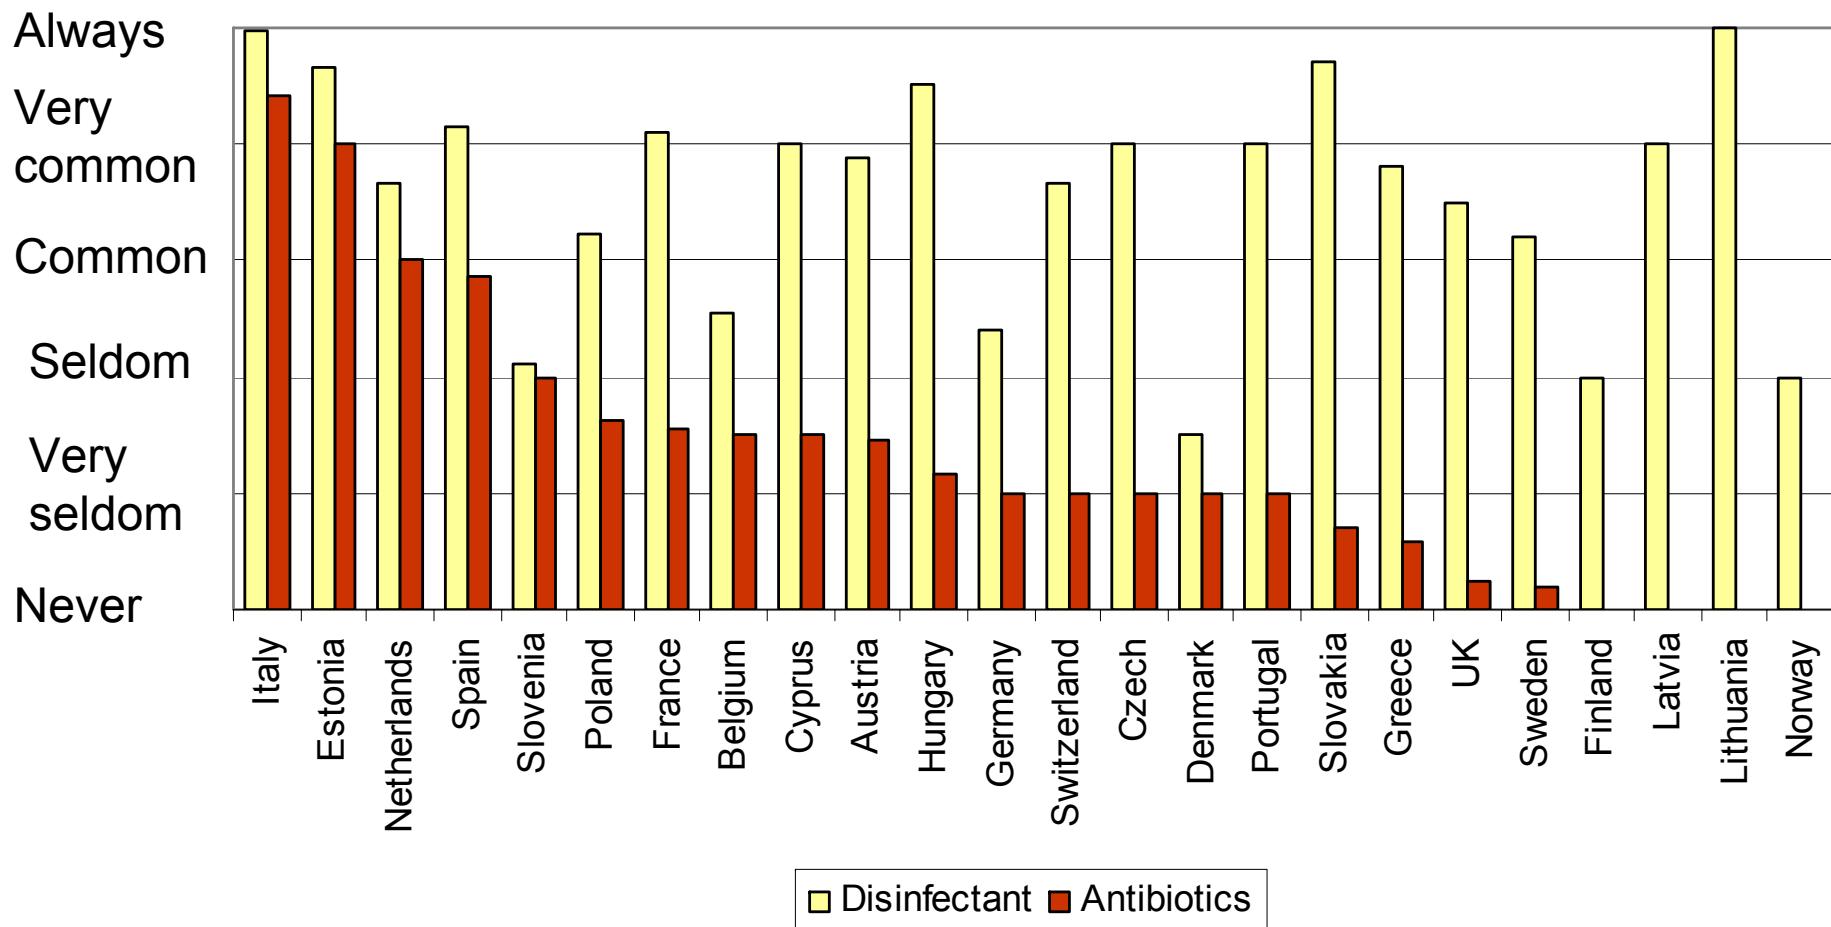

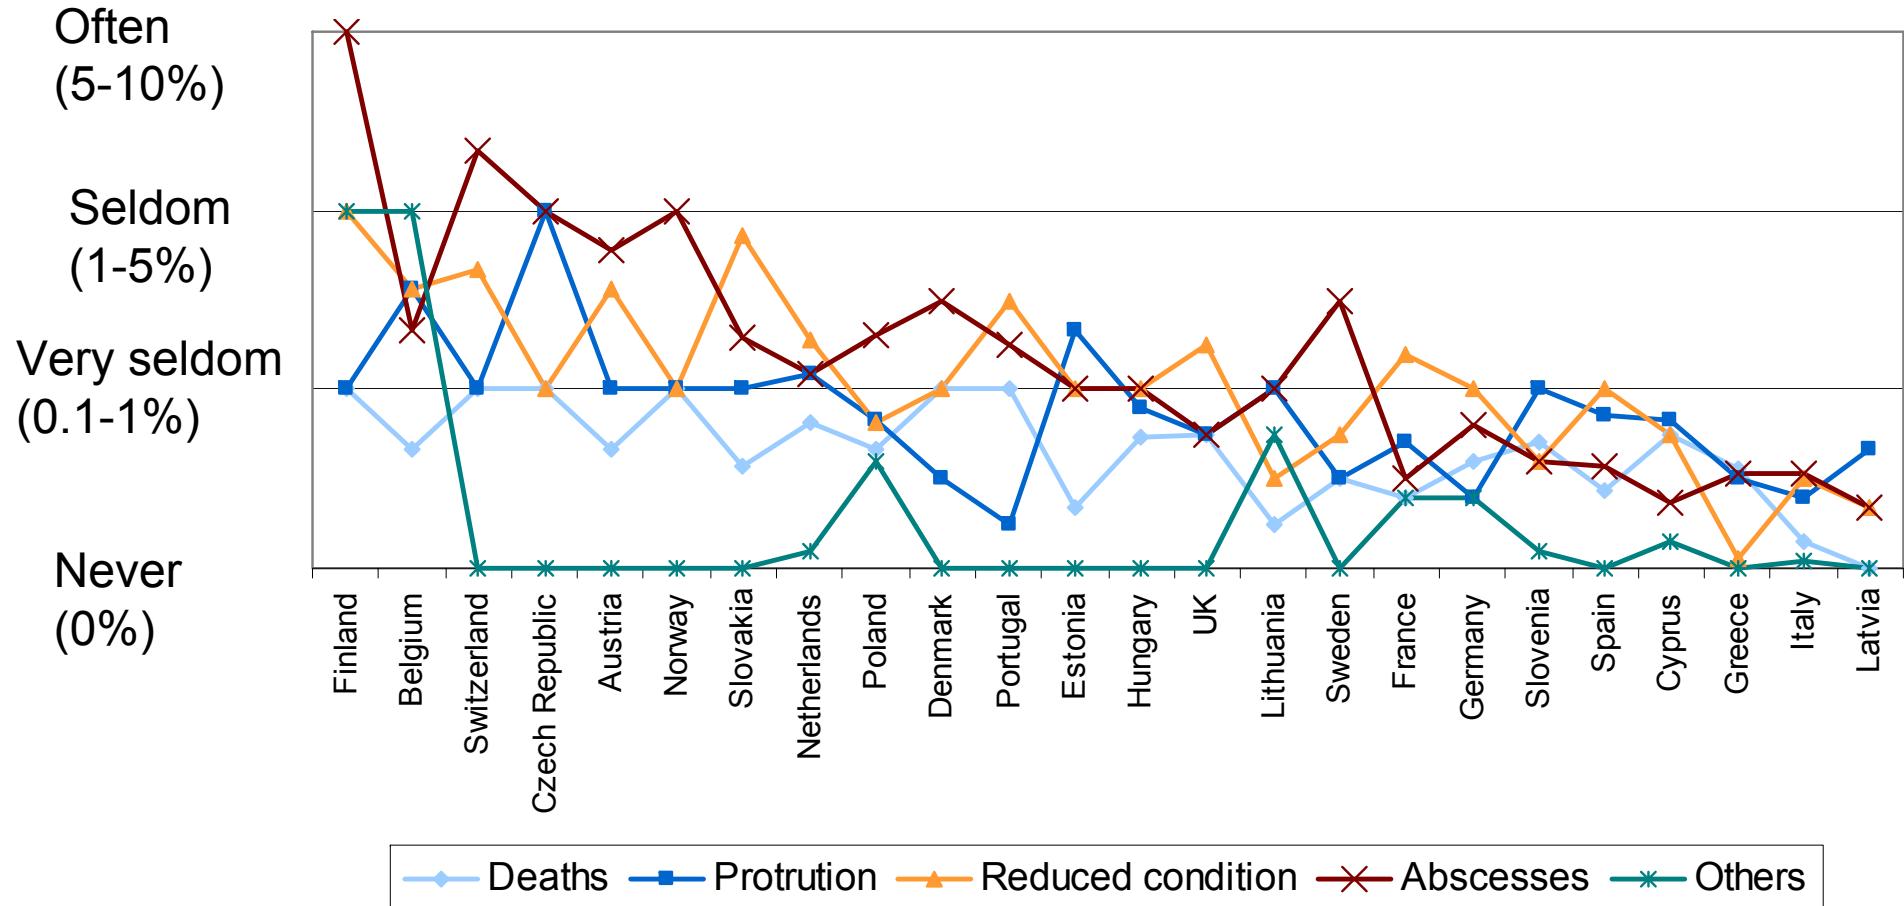

Time consume - castration

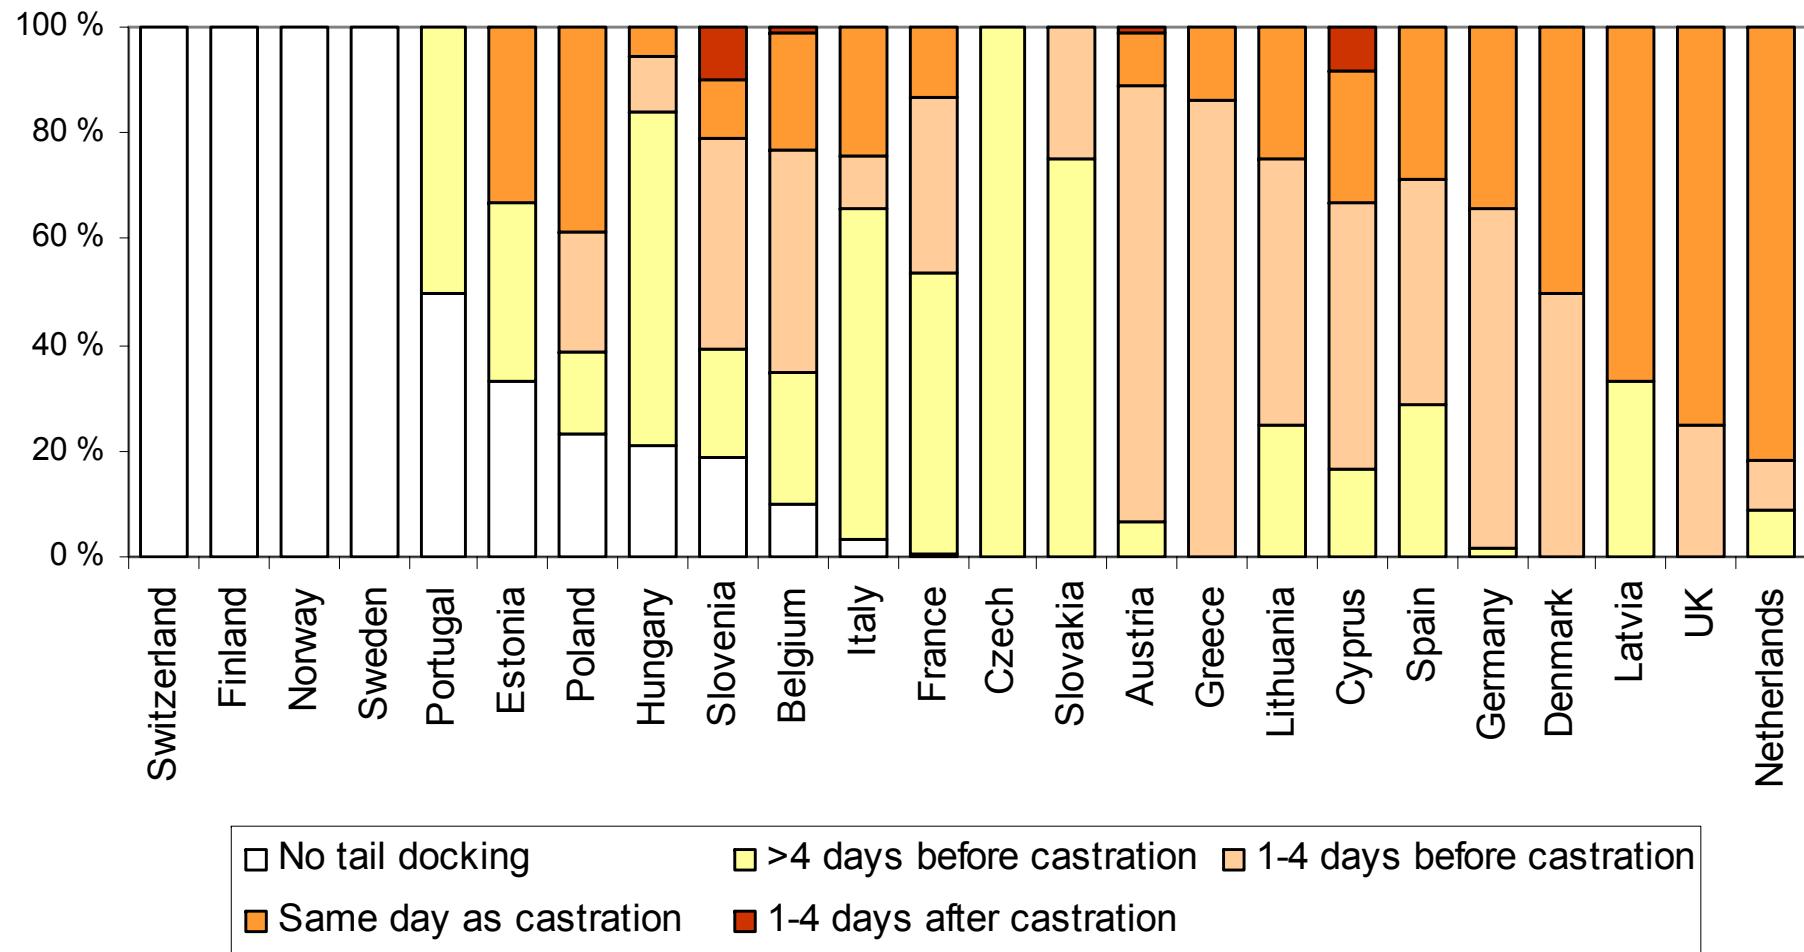

Use of disinfectants and antibiotics

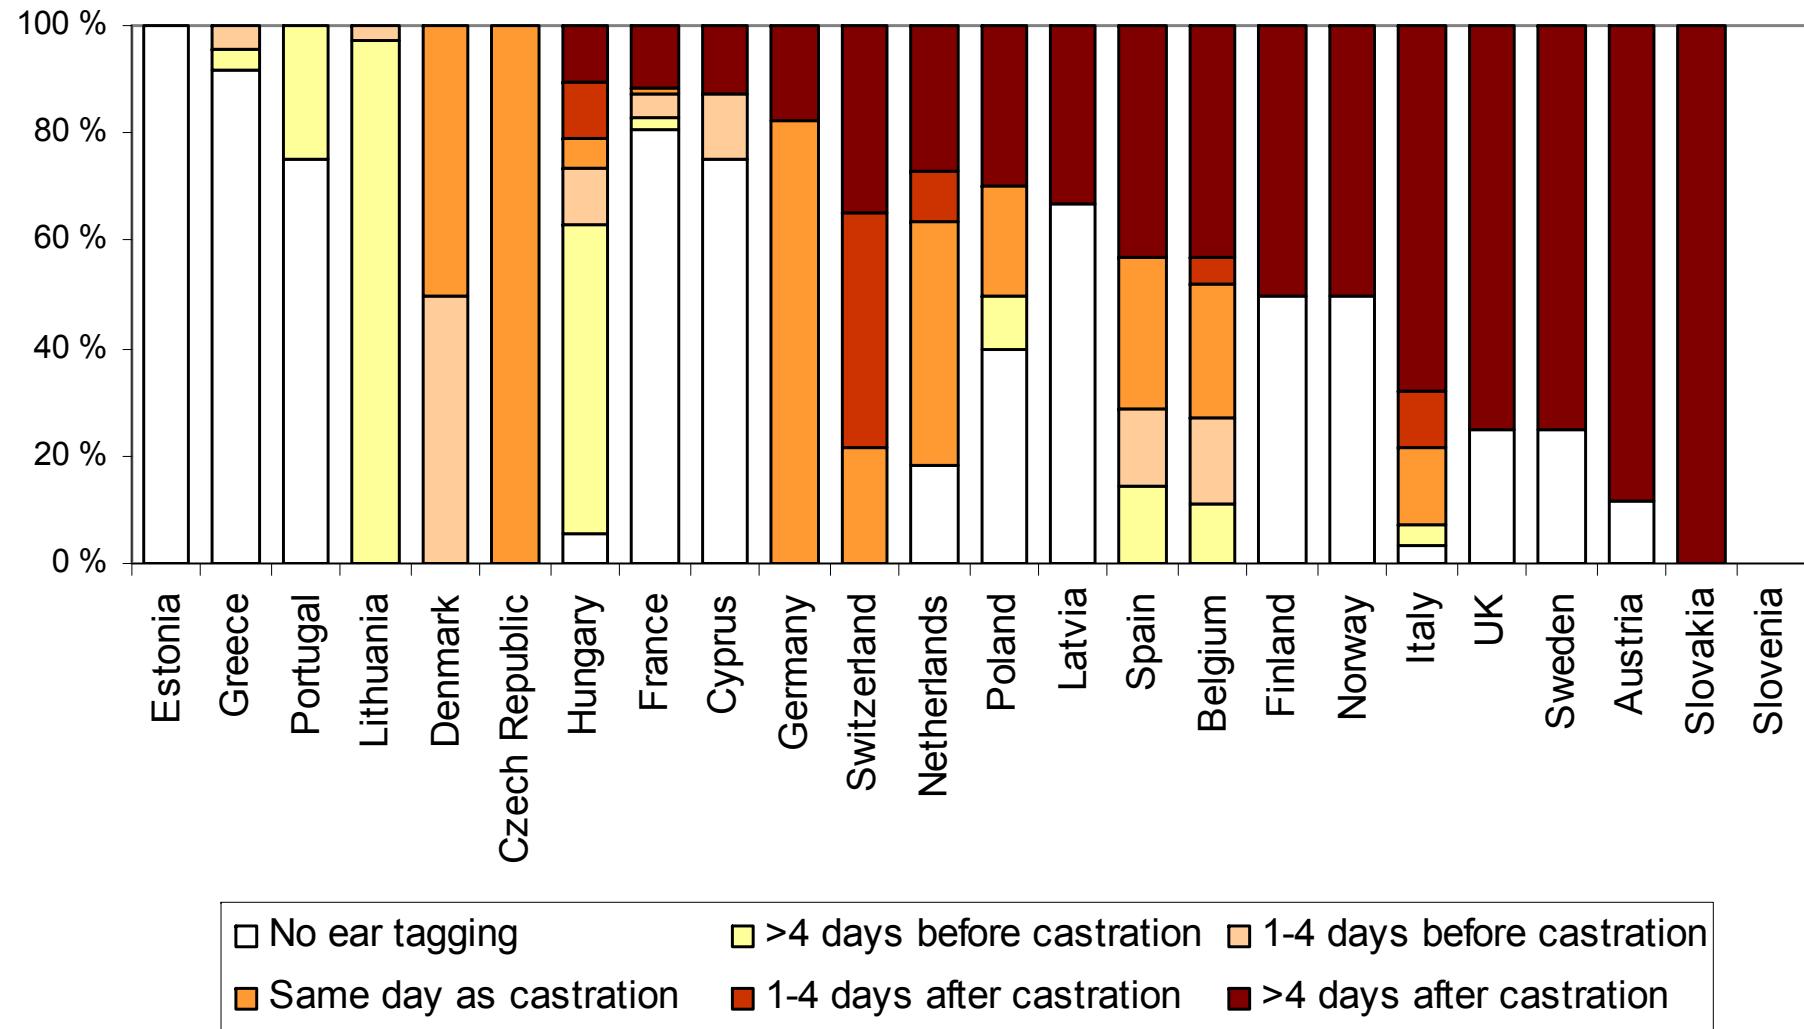

Complications

Tail docking

Ear tagging

Conclusions

- Castration is very common in most countries
- Some countries find it possible not to castrate
- Use of anaesthesia and analgesia is rare
- Age at castration and procedures for castration differ widely both within and between countries
- Adverse consequences are rare
- Practices are similar in conventional and organic systems, but differ markedly for some extensive systems

Thanks to

- The regional co-ordinators and national contacts that have gathered all the data

<i>Region</i>	<i>Regional co-ordinators</i>	<i>Countries (National contact persons)</i>
