### Model Comparison for Genetic Analysis of Clinical Mastitis in Norwegian Red cows

### Linear, Threshold, Censored Threshold and Zero Inflated Poisson models.

### Introduction

Many different models suggested for genetic analyses of clinical mastitis defined as single trait, multiple traits or longitudinal trait

e.g. linear, logit, threshold, multivariat threshold, longitudinal threshold, censored threshold, ZIP model, survival analyses, .....

Model comparison a challenge!

Different scales and different trait definitions

### Mastitis traits

Absence/presence during a period,

y=0,1.

Possible models: linear model, binary models (logit or probit threshold).

Count of cases during a period,

y=0, 1, 2, ...

Possible models: linear, ordinal threshold, Poisson and Zero-inflated Poisson (ZIP) models.

## Objectives

Compare the performance of Zero-Inflated Poisson (ZIP) model with censored ordinal threshold and linear models for count of mastitis cases and threshold and linear models for absence/presence of mastitis, for genetic analysis of clinical mastitis in Norwegian Red cows.

### Materials and Methods

### Data

- 620,492 1<sup>st</sup> lactation Norwegian Red cows
- Daughters of 3,064 sires
- From 51,808 herd-5-year groups
- Mastitis data from the cows health card: veterinary treatments of clinical mastitis from -30 d before to 300 d after first calving.

## Traits

- CM: Absence / presence of mastitis in the period from 30 days before to 300 days after first calving
- NCM: Number of CM treatments during 1<sup>st</sup> lactation
  - From 30 d before to 300 d after calving
  - Min. 5 days between treatments
  - 3 categories: 0, 1, and 2 or more cases of CM
  - Cows culled before 300 d were censored

| No of cows with NCM     | 620,492 |
|-------------------------|---------|
| Mean NCM                | 0.22    |
| % censored cows for NCM | 30      |

#### Distribution of cows over NCM categories

| NCM All cows Censored Non-censored |    |    |    |  |  |
|------------------------------------|----|----|----|--|--|
| 0                                  | 81 | 77 | 82 |  |  |
| 1                                  | 16 | 19 | 15 |  |  |
| ≥2                                 | 3  | 4  | 3  |  |  |

### Models – CM (binary trait)

#### **Threshold liability model**

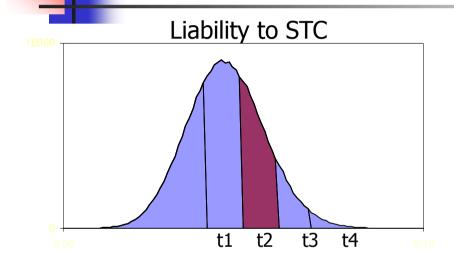

### $\lambda = X\beta + Z_hh + Z_ss + e$

- $\lambda$  vector of unobserved liabilities of CM
- β vector of systematic effects
  - age (21 classes) and mo-yr (288 classes) of first calving
- **h** vector of herd-5-year period of calving effects (51,808 levels)
- **s** vector of sire transmitting abilities
- e vector of residual effects
- $X, Z_{h'}$  and  $Z_{s}$  incidence matrices

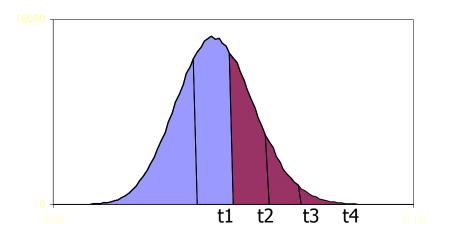

### Models – NCM (ordered categorical trait )

- Linear model
- Censored threshold model (Chang et al. 2006; Heringstad et al. 2008)
- Zero-Inflated Poisson (ZIP) (Rodriguez-Motta et al., 2006)

### Taking censoring into account

Non-censored cow with STC=3t2  $\leq$  liability < t3

Censored cow with STC=3liability  $\geq t2$ 

### **ZIP: Zero inflated Poisson**

- Account for extra zero's
- Better predictive ability than Poission model for NCM (Rodrigues-Motta et al. 2006)

S: state 0 (will never have mastitis): p 1 (might have mastitis): 1-p

Y (mastitis):{ 0,1,2,...} 
$$\begin{cases} P\{Y=0\} = p + (1-p)e^{-\mu}\frac{\mu^0}{0!} & y = 0,1,2,... \\ P\{Y=y\} = (1-p)e^{-\mu}\frac{\mu^y}{y!} \end{cases}$$

## Model comparison

- Predictive ability
- Four-fold cross-validation
- Mean squared error of prediction (MSEP)

### **Results and discussion**

Posterior means of sire, herd-year and residual variances, and heritability.

|              |          |           | Censored  | <b>Zero-inflated</b> |         |
|--------------|----------|-----------|-----------|----------------------|---------|
|              | Linear   | Threshold | threshold | Poisson              | Linear  |
| Variance     | (binary) | (binary)  | (count)   | (count)              | (count) |
| Residual     | 0.144    | 1.000     | 1.000     | 0.034                | 0.220   |
| Herd         | 0.009    | 0.132     | 0.139     | 0.266                | 0.014   |
| Sire         | 0.001    | 0.019     | 0.023     | 0.043                | 0.002   |

| 2083 | 11       | 10         | 32 | 17  | 10      |

Mean squared error of prediction in crossvalidation, with binary response (CM).

|          | Linear   |           |       |       | Linear  |
|----------|----------|-----------|-------|-------|---------|
|          | (binary) | Threshold | СТ    | ZIP   | (count) |
| Total    | 0.160    | 0.161     | 0.180 | 0.157 | 0.163   |
| Healthy  |          |           |       |       |         |
| cows     | 0.042    | 0.039     | 0.099 | 0.035 | 0.057   |
| Diseased |          |           |       |       |         |
| cows     | 0.659    | 0.675     | 0.521 | 0.674 | 0.610   |

Mean squared error of prediction in crossvalidation, with the counts response (NCM).

|                    | Linear   |           |       |       | Linear  |
|--------------------|----------|-----------|-------|-------|---------|
|                    | (binary) | Threshold | СТ    | ZIP   | (count) |
| Total              | 0.245    | 0.246     | 0.258 | 0.243 | 0.246   |
| Healthy cows       | 0.042    | 0.039     | 0.099 | 0.035 | 0.057   |
| Cows with 1        |          |           |       |       |         |
| mastitis           | 0.659    | 0.675     | 0.520 | 0.674 | 0.609   |
| Cows with $\geq 2$ |          |           |       |       |         |
| mastitis           | 3.283    | 3.318     | 2.950 | 3.319 | 3.171   |

## Conclusions

- Overall MSEP was smaller for ZIP
- <u>Healthy cows</u>, better predicted by ZIP model followed closely by threshold
- <u>Cows with mastitis</u>, better predicted with censored-threshold model, followed by the linear for counts model
